MacGuire said that the same people with the money [also controlled the press](#), and would concoct a rationale that Roosevelt was ill and needed a strongman to help run the country. The public would easily swallow it, and Butler would be installed in a new cabinet position as Roosevelt's right hand, in a position dubbed the "Secretary of General Affairs." MacGuire had been studying the Italian and German Fascist "miracles," and the plan was closely modeled after Hitler's Brown Shirt coup. They would ease Roosevelt out of office, and Butler would be America's new Hitler.

They picked the wrong man. Although Butler had been openly critical of Mussolini, they thought that Butler could be controlled. MacGuire mentioned other candidates they would approach if Butler turned them down, such as Douglas MacArthur. MacGuire even told Butler that his superiors doubted that Butler would obediently play the game right, but nobody else in America could gain the ready allegiance of millions of veterans. Butler did not say anything publicly and played along, trying to find out more, such as who was behind it. Butler enlisted *Philadelphia Record* reporter Paul French to dig deeper into the situation. Butler introduced French to MacGuire, and French gained MacGuire's confidence. MacGuire told French the same story that Butler heard. They tried getting MacGuire to give them more names, but he was too smart for that. Butler met one rich conspirator who said that he would spend half his fortune to save the other half.

When he got all the information he could, Butler went straight to the House Un-American Activities Committee (HUAC) in 1934, telling them all he knew. As with [many other official "investigations,"](#) the HUAC was decidedly timid in pursuing those allegations. They refused to subpoena the names Butler had given them except for MacGuire, who predictably denied everything. The other names given by Butler to the HUAC were former-presidential contenders John Davis and Al Smith (who was a [Morgan](#) attorney), and Grayson Murphy, who was a co-founder of the American Legion, a board member of organizations such as Morgan Bank, Goodyear and Bethlehem Steel, and MacGuire's boss. The committee, which went to great lengths to ferret out commies, lost their zeal when confronted with those rich and powerful names, and largely swept the affair under the carpet. However, Butler went public. Nevertheless, without official corroboration, no other investigations were launched, nor did

anybody in government appear too concerned. The establishment and [media](#) went out of its way to either ignore or slam Butler, with *Time* magazine openly ridiculing him. The rich conspirator that Butler met threatened to sue Butler for libel, but Butler's stance on Mussolini showed how easily intimidated he was. The conspirator never sued, and Butler never backed down.

While the HUAC's public posture was a quiet folding of its tents, it issued an internal report to Congress which journalist John Spivak obtained. The HUAC internal report told a starkly different story. The report to Congress stated that its investigation confirmed that Butler's story was true in every particular they could verify, and that MacGuire had perjured himself when he denied it.[\[26\]](#) The truth was there, even documented in a report to Congress, but it got swept under the rug, as with most American scandals that involve the rich and powerful. Case closed!

A Brief History of Western Anti-Semitism and the Holy War Mentality

Another minimized chapter in American history is that while Hitler was pursuing his Final Solution, anti-Semitism was reaching its high-water mark in U.S. history. Anti-Semitism in America reached its highest levels during the Jewish Holocaust of World War II, as it did throughout the West. Hitler was merely the most extreme of the bunch. One of America's most prominent historians, the self-taught Barbara Tuchman, described the mood of the West during those years when she said that with few exceptions, "The Gentile world...would fundamentally have welcomed the Final Solution."[\[27\]](#)

No nation has been as intensely racist for as long as the United States has. It is that way today as I write this, with my nation killing off [close to a million children in Iraq](#). If they were white children, it would not be happening. When America was killing off [millions of Southeast Asians](#) during the 1960s and 1970s, America invoked the "mere gook rule" to absolve U.S. soldiers of legal accountability for their mass murders of natives that they were supposedly saving.[\[28\]](#) In [America during the 1800s](#), the surest way to garner votes was to run for office as an "Indian fighter," which was often a euphemism for killing native women and children while the men were away on hunting expeditions. When Southern blacks were finally freed and the Reconstruction government left, [blacks began hanging from trees in the South](#) like Christmas tree ornaments. Lynching became so popular that late in the 19th century the murderers would proudly pose next to the dead or burning black man, with women posing too, knowing that they would never be convicted, even when posing for photos to commemorate the occasion.[\[29\]](#) The death squad regimes that the United States has recently supported in places such as [El Salvador](#), [Guatemala](#) and [Indonesia](#) slaughtered non-whites. The United States will rarely support the slaughter of white people, except in the [cancer racket](#) and other

hidden holocausts, but nearly all people of color are fair game. There was almost undoubtedly a strong racist motivation regarding the United States' [dropping of atom bombs](#) on Japan in 1945.

Here in Washington, my uncle told me about a place in the mountains called "China Cliff." Chinese coolies completed the railroad over the mountains, and when it came time to pay them, the railroad management had them pushed off a cliff into a canyon, killing hundreds of coolies. Killing them instead of paying them was far cheaper, and earned the landmark the name of "China Cliff." If that had happened to white people, there would be a monument erected there. A friend recently told me of a similar coolie landmark in Idaho, where killing them was cheaper than paying them.

The United States is a nation [built on the red man's bones](#) and the sweat and tears of the black man and other "inferior" races. Our hallowed [Declaration of Independence](#) grandly stated the self-evident truth that all men are created equal. When the even more hallowed U. S. Constitution was drafted years later, it gave force to those words of [Thomas Jefferson](#) and other Founding Fathers, but qualified the sweeping language a little. All *white*, land-owning *men* were created equal. Women, slaves (white *and* black; white slaves were dubbed with the euphemistic term, "indentured servants"), natives and white men who did not own (recently stolen native) land were specifically excluded from coming to the table and having a hand in their governance. That was a *slight* improvement over the European monarchies. Founding Father John Jay voiced the day's mentality when he said that *the people who own the country should run it*. [George Washington](#) was reputedly America's richest man when he became president, increasing his wealth by stealing native land. In 1782, Washington devised a plan to steal the native land by forcing them into signing treaties that the [U.S. would never honor](#), a strategy quickly adopted by the government, as evidenced by the fact that historians cannot find one treaty that the United States honored with Native Americans.

Jews were white people, sort of. Racism in America has become covert in recent years. There are not racist laws on the books anymore. America used to have *de jure* segregation, now it is *de facto*. Nobody can publicly spew racist sentiments unchallenged, which is an improvement, but racism is far from dead in America. There are no more colored bathrooms, but other measures show how racist America still is. For instance, when the blacks were freed after the Civil War, their income was about 20% of white income. By 1900, it was clear up to 30%. Then the noted racist [Woodrow Wilson](#) came into office and reversed the gains the blacks had made. By 1940, black income was *less* than it was in 1900, as a ratio to white income. Then the golden era of black improvement occurred. Between 1940 and 1970, black income per capita shot up to sixty percent of white income. It is not coincidental that those economic improvements happened during the Civil Rights era and unprecedented U.S. global hegemony. From Martin Luther King's assassination in 1968, until 1990, black family income actually *declined* as a ratio of white income. Not only did it decline between 1970 and 1992 relative to white income, it also declined in real dollars.[\[30\]](#) The laws are not explicitly racist

anymore, but the system still churns out the disparity. The blacks won the legal battle, in a way, but lost the economic one.

In 1940, Jews were a short step above "niggers" in America's hierarchy. There were many jobs that a Jew could not have in America, similar to the restrictions they had lived under in Europe for centuries. Similar to signs in the South that said they did not serve "Negroes," signs on America's East Coast often said "no Jews allowed." I saw one Jewish woman reminisce about her childhood, talking about going to an East Coast beach, and the sign said "No Jews or dogs allowed."[\[31\]](#) As this essay covers American anti-Semitism, bear in mind Leonard Dinnerstein's words as he concluded in his *Anti-Semitism in America*, published in 1994,

"Anti-Semitism is unlikely to vanish in the United States. It is too much a part of the Christian culture to disappear. It must also be emphasized, however, that in no Christian country has anti-Semitism been weaker than it has been in the United States."[\[32\]](#)

In August 1999, a member of the neonazi Aryan Nation group shot children at a Jewish school in Los Angeles, killed a Filipino postman, and was proud of his crimes, calling them a "wake up call for America." That shooting incident triggered many anti-Semitic acts across America, including the desecration of synagogues. Fortunately, most Americans were horrified, but that it even happened shows how far we have to go. In the West before World War II, the United States was the haven for Jews. Jews were treated better in America than anywhere else in Europe.

The Jewish people were originally one of many tribal peoples of the Fertile Crescent. In about [2000 BC](#), there was a great invasion from the steppe regions, and pastoral peoples, with their male, sky-god deities [overthrew the settled agricultural peoples](#), with their female, earth-goddess deities. During that time of tumult, many of the settled peoples of the Fertile Crescent (today's Iraq and vicinity) migrated toward the Mediterranean, and a man today known as Abraham migrated with them, eventually settling in the vicinity of today's Israel. Abraham also began something unique, in that he seemed to have a relationship to *one* god, not the teeming pantheon of gods that dominated the polytheistic religions of the era.

Those days were during that region's Bronze Age, and they were extremely violent. Abraham's tribe lived and grew in numbers in their new home, and over the generations they fragmented into distinct tribes. The peoples the Bible records are the ones that eventually migrated to Egypt, which had the ancient world's most reliable food supply. Through the vagaries of life in Egypt, they eventually became a slave class, and under their great leader

Moses they escaped Egyptian slavery, and wandered for about fifty years in the Sinai Peninsula. It was during that time that they developed a definite monotheistic code, as laid down by Moses. It was unique in the ancient world. Their oral histories tell of their God promising them a land, and under Moses' bodyguard Joshua they invaded Canaan, [the slaughter of the citizens of Jericho](#) (perhaps the world's oldest city) being the most infamous example of how the "Israelites" secured their "Promised Land." That probably happened around 1200 BC. The Jewish belief system, as practiced through Mosaic Law, created by a law-giving God, established a tribal coherence that was unique, yet it also made them a target. They saw themselves as God's chosen people, and often kept themselves rather apart from other tribes. With their strict dietary laws and rites such as circumcision, they often became outcasts, and even preferred that status at times.

The monotheism of the Israelites was also rather hostile to the notion of secular states, elevating "God's" laws over the laws of men, which created a tension in the relations of church and state that continues to this day. The Jewish people set about conquering/annihilating the inhabitants of their Promised Land, and their empire-building peaked with David, whose reign ended in about 966 BC. The Jewish state declined after that, beginning with David's son Solomon, who began turning the conquered peoples into slaves, which was repugnant to church leaders who recalled their people's days of Egyptian slavery. The church and state dichotomy went through various shades of unity and separation during those days, as the Mosaic code did not mesh well with state imperatives. The Israelites battled their neighbors and went through a long decline. The Assyrian Empire invaded and conquered the Israelites' northern lands, climaxing with the conquest of Samaria in about 721 BC, and carried away ten tribes of Israelites, with their assimilation into the Assyrian Empire being so complete that those people are lost to history.

The beginning of the Jewish Diaspora really began when the Babylonians rushed into the void created by the Assyrian Empire's defeat, and conquered Jerusalem, which the Assyrians never accomplished. In 597 BC, the first Jewish elites were [forced to migrate to Babylon](#), which began the Jewish Diaspora. The Babylonian Exile lasted until the Persian king Cyrus the Great conquered Babylon in 539 BC, and the Jews were free to go home. Most preferred to stay, however, and Babylon became a center of Jewish culture for more than a millennium. Cyrus was a student of Zoroaster's teachings, and the dualistic nature (good/evil) of Judeo-Christian thought came from Zoroaster.

In those lands of rising and falling empires, the Greeks made their ascendance after the Persians sacked Athens in 480 BC. The Greek classic period peaked in about 432 BC, just before their Peloponnesian War that began in 431, with a resulting epidemic in 430 that carried off about a third of Athens' population. Greek culture, although early Greek writers looked up to Moses and other Jewish leaders, was markedly different than Jewish culture, the Greeks becoming the West's first humanists. Greek culture was very assimilative, and it readily adopted foreign gods into its pantheon, even deifying men who lived exemplary lives. Under

the Macedonian Alexander the Great, whose reign conquered lands from Egypt to Persia and peaked in about 326 BC, as he even conquered part of India, Greek (Hellenistic) culture spread far and wide. Jewish culture began assimilating into Greek culture, especially among its far-flung Diaspora. The Jewish homeland, however, was less cosmopolitan and more orthodox in its religious practice, and great division arose within the Jewish people, with those who wanted to “modernize” on one end of the spectrum, and those who tried keeping Judaism “pure” on the other.

The antagonism between Greek and Jewish culture became heated by 150 BC, especially as the Greek culture “conquered” the Roman one, with Rome assimilating Greek culture after it conquered them. Greek eventually became the official language of the Byzantine Empire, and was the official language in some Roman provinces in Jesus’ day. By the time of Jesus, Greek culture was so dominant that the New Testament was entirely written in Greek, and the names Jesus and Mary are Greek versions of their Hebrew names Joshua and Miriam.

The Roman Empire conquered Jerusalem in 63 BC. The Jews had a prophetic tradition that a messiah would one day appear to deliver them. They believed that their messiah would be a king to lead great armies to destroy their enemies. Well, their messiah probably *did* appear. Instead of a righteous warrior king, along came a crazy Jew who had a strategy for eradicating the enemy by a method never tried before: *loving* the enemy. Even today, such an idea is crazy, virtually never even attempted in the intervening two thousand years. Although he gave incredible demonstrations of the power of love, demonstrations that are called miracles today, his message of love was so bizarre that it was largely rejected. He had followers, but the one who became the most famous corrupted his message. The “good news” was the infinite love of God, not Jesus, a distinction that Paul did not appreciate, nor did the religion that he founded in Jesus’ name: Christianity. Jesus’ message was love, the greatest message ever told. It did not completely fall on deaf ears, but his message gradually became corrupted, beginning with Paul who altered the good news *from* Jesus into the good news *about* Jesus.

Ignoring Jesus’ message about loving the enemy, the Jewish revolt in 66 AD brought the Roman fist down on the Jews. Jews had already been dispersed throughout the Roman Empire (about 70% of the world’s estimated eight million Jews of the day lived outside Palestine), but the Roman conquest of Jerusalem in 70 AD, turning it into an official part of the Roman Empire, dispersed the Jews throughout the Mediterranean periphery and into today’s France and Spain. The Jewish dispersal also dispersed the new cult known as Christianity. In great irony, the “Good Book” of the Christians was a book written by Jews about Jews. The Old Testament is a Jewish history book. Jesus, Paul and John the Baptist were all Jews. The first Christians were Jews, and they spread Christianity. Through a series of tragic events, the people who embraced the teachings of a radical Jew, as taught by his Jewish followers, developed a hatred for the very people who produced such a master and teaching. Christians took to heart the Jewish history book and the teachings of their greatest prophet, but had no use for the people themselves.

Jews were largely scattered throughout the Roman Empire, although a fair number migrated to Arab lands in Mesopotamia and elsewhere. In those early days of Christianity, the Roman Empire was officially pagan, which generally meant that any belief was fine as long as people bent their knees to the emperor. What got the early Christians thrown to the lions was not their faith, *per se*. They put their faith and God higher in their esteem than the emperor, and their radical *politics* earned them the empire's enmity. They originally lived communally and austere, sharing their possessions with each other, something quite out of step with the times. [33] They also condemned paganism as wicked, which won them few friends. Christianity was not very old before it became a ruling class religion. Early Christian figures such as Paul, Augustine, Origen, Ambrose and Jerome were either from the ruling class or catered to them. [34]

Christianity was originally a radical Jewish splinter sect, which became many splinter sects, adopted by non-Jews as well, especially the hated Greeks. The first revolt ended badly, capped off with the mass suicide at Masada in 72 AD. The Roman army crushed a second revolt in 135 AD, which killed hundreds of thousands of Jews. The revolts not only scattered the Jews, but also created a lasting rift between radical Jewish Christians and old line Jews, and set in motion dynamics that plague Christian-Jewish relations to this day.

Early Christianity was diverse. By the year 200 AD, there were about forty Christian sects. There were about *twenty* different versions of the crucifixion drama circulating in those sects: Jesus died on the cross, he survived crucifixion, he was not crucified, the Romans were behind it instead of the Jews, and so forth. Those forty sects were not one big happy family. One Roman observer said that *nobody hated Christians more than other Christians*. Each sect had its own holy writings that justified its views, and they often thought the other sects were wrong.

Until Constantine organized the Council of Nicea in 325 AD, there was not appreciable unity within Christianity. The likely reason that Constantine chose Christianity as the state religion was to unite the slowly disintegrating empire under one faith, to help hold it together. [35] Christianity had become successful enough that it was a logical candidate, and made an unprecedented rise from an obscure, marginal, radical movement, with more than forty sects, often battling with each other, to becoming the state religion. After the Nicean Council, Christianity became the Roman Empire's state religion. Many suspect that the Nicean Council is where a great deal of editing happened. There had to be one story, not many competing versions. The official story today is that the books of the New Testament were chosen based on how authentic they were, but there is plenty of evidence that political expediency and power issues had much to do with it. [36] A primary thrust of the Nicean Council was condemning a Christian sect called Arianism, which believed that God was the highest power, and Jesus, being a Son of God, was of lesser stature. The Arian belief was largely responsible for the idea of a Holy Trinity (one of many Christian beliefs that are *not* in the scriptures), and the Nicene Creed was a direct response to Arian belief, as it stated that Jesus was God. [37]

Condemning Arianism, the Christian hierarchy nevertheless attempted to unite the faith. The documentation regarding that first council is sparse, but many suspect that writings not deemed politically acceptable were edited out of the Bible at the first council. Writings may have also been inserted to further the day's political goals. By burning the pagan works (including all the Classical Greek ones), [Cathar](#) writings, ancient libraries, the Aztec and Mayan books and so on, the Church was effective at completely eradicating what it did not approve, leaving historians scratching their heads, wondering how much was lost in the Catholic bonfires. It is argued that the Church's eradication philosophy is mainly what brought on the Dark Ages.[\[38\]](#) There is little overt evidence of what happened to the New Testament, but plenty of suspicious evidence. Probably the greatest evidence is the ungainly hole in Jesus' life. Sunday school children are told that Jesus spent his teenage and early adult years working as a carpenter. The New Testament gives *zero* evidence for such a belief. From age twelve to thirty, there is *not one word* about what Jesus was doing with his life. More than half of Jesus' life is missing. It vanished.

My [mystical sources](#) have long told me that the Council of Nicea was where much of Jesus' life was "weeded out" of the New Testament. That was partly because he spent those "lost" years traveling the world on his spiritual pilgrimage. He attained his enlightenment outside of the Roman Empire, gaining valuable insights from the Buddhaic and Hindu masters of the East, with their ideas of reincarnation and other ideas that were unacceptable to the imperial religion.[\[39\]](#)

Thusly did Jesus' life and teachings make it to the big time, although what it became was probably nearly unrecognizable to Jesus. Yet, in its core, it was still about love. The adoption of Christianity by the Roman Empire was not as easy as Constantine may have hoped. His successors fought for years over the issue of Christianity, and Christianity and Paganism went at it tooth and nail at times, and Christianity prevailed. In the end, Christianity adopted many of the Pagan rites, partly to market it, further altering Christianity.

There is only one word worth remembering about Jesus' life: love. Using ancient teachings to justify judging, killing, punishing or oppressing people is not enlightened. It is not what one believes that gets them into "heaven," so much as it is [how they act](#). *All* religions are corrupted, not just Christianity. The Dalai Lama may have said it best when he said, "My religion is kindness."

Regarding holy words, it is instructive to recall that neither Jesus nor Buddha left behind any writings. Spiritual teachings have stated that when the master has left earthly life behind, the teaching is finished, and any writings left behind belong to the realm of philosophical literature, not the basis of religions. Jesus and Buddha cannot have believed much in the holiness of written words if they did not leave any behind.

Early Christians *were* persecuted and killed, which was typical in those days. The Coliseum,

along with other arenas around the empire, was the site of constant bloodbaths. The Roman equivalent of going to the movies was going to the arenas and watching staged battles, put on for the masses' entertainment, a tradition that lasted for about 1000 years in that region. The prime attraction at the arenas was gladiatorial combat. Originally an Etruscan funerary rite, gladiatorial combat evolved into the Roman Empire's primary entertainment. The gladiators were usually slaves, one of many slave classes in the Roman Empire, which meant that they were people conquered and captured by Rome's armies. They were trained for battle in the arena. While one-on-one combat was most common, group battles could become extravaganzas. Augustus Caesar once had 10,000 men fight each other in eight battles. The battles were usually to the death.

Roman historian Michael Grant noted that history's "two most quantitatively destructive institutions are Nazism and the Roman gladiators."[\[40\]](#) Any appreciative musings about Roman achievements in the area of law, architecture, economics and other "advances" of civilization need to be tempered by considering the unparalleled evil of forcing people to murder each other...for *entertainment*. The Romans themselves were not too proud of that form of entertainment, as imperial Roman coinage, which depicted all manner of Roman life and culture, never portrayed gladiatorial combat.[\[41\]](#)

The thumbs up, thumbs down gesture came from those times, when a gladiator might be spared if he fought valiantly enough. So the audience would not become bored, the events were creative. People fought lions, tigers and bulls. Fights were staged with lion against tiger, elephant against rhinoceros, bear against water buffalo. Other novel offerings were dwarves and cripples against women. The Coliseum could be filled with water for naval battles. A gladiator was nearly always doomed to an eventual death in the arena, although many killed themselves first. If a gladiator became the day's "hero," he would be showered with gifts and applause, only to go into battle the next day. Sometimes it was declared that no warrior would be allowed to survive the day, and every one would have to fight to the death.[\[42\]](#) Few survived long enough to "retire." That was the favored *entertainment* of the day. Criminals and Christians were among those condemned to die in the arena. Few Romans ever complained or questioned the nature of that entertainment.[\[43\]](#) In those times, cruelty and bloodshed was equated with fun. The more cruel a spectacle was, the more the crowd liked it.[\[44\]](#)

What is generally credited with the end of gladiatorial combat was the spread of Christianity, although it was far from an immediate effect. Emperor Constantine, who made Christianity the state religion, issued an edict forbidding gladiatorial combat in 326 AD, the year after the Nicean Council, but he never enforced the order. Constantine was hardly a "good Christian," having both his wife and son executed, his wife by boiling her. Constantine staged some of the gorier spectacles that ever graced the Coliseum. For Constantine, Christianity was a strictly political matter. In 404 AD, a Christian monk from Asia Minor apparently leapt into the arena to try separating the combatants, and the enraged crowd tore the man to pieces.

Gladiatorial combat was not finally abolished until 681 AD.[\[45\]](#)

The earliest Christians were Jews, and Rome considered Christians a Jewish sect. By 212 AD, Jews became imperial citizens, and their life was as good as the times could dictate, until Constantine made Christianity into the state religion in 325 AD. Then the Jews began a hard ride. Although the Christian hierarchy at the time did not advocate anti-Jew violence, Christian mobs regularly burned down synagogues. Babylonia, outside of Christian and Roman influence, became the center of Judaism by 300 AD. Pagans were being wiped out too, even while Christianity appropriated many of its customs. Christian intolerance replaced the laissez faire spirituality that characterized pre-Christian Rome.

Power corrupts, and as the Christian church became more powerful, pagans and Mosaic Law Jews paid heavily. Constantine's ploy was not very successful, as the Western Roman Empire crumbled in 476 AD.

Jews were dispersed across the Roman Empire and further, and when the Empire collapsed, the Catholic Church became Europe's unifying institution. It was a different kind of Roman Empire. For all its spectacular failures and the great evils it would eventually wreak on its subjects, the Catholic Church may have held European civilization together for the next five hundred years.

As the Catholic Church gained in strength as the state church, it became increasingly bigoted and racist. Although three early popes were black Africans (Miltiades, Victor 1, and Gelasius 1; saints Augustine and Benedict were also black) the Church became decidedly racist, and Vatican artists later "whited out" those African popes and saints.

When the Western Empire crumbled, the Eastern Empire, under almost wholly Greek influence, was not inviting, so Babylonia became the center of the Jewish world. Around 600 AD another radical splinter sect of Judaism took root, led by a prophet named Muhammad. He was more the messiah that the Jews originally sought: a sword-wielding destroyer of his enemies, but one who also lived by a moral code, conversed with his God, and the religion of Islam took root and swept the Arab lands and further. Although Muhammad killed his fair share of Jews, they were treated far better by the Islamic code than the Christian one in those days. Although the spread of Islam was often bloody, and conversion by the sword was sometimes a method of Islamic proselytizing, it was a decidedly color-blind faith, which was part of its appeal to people of color. The rapid expansion of the Islamic faith in the 600s and 700s brought many Jews under Islamic rule. Jews existed more peacefully under Islamic rule than Christian rule, and consequently they lived in greater numbers in the Islamic world than the Christian one. Islam conquered the Mediterranean's southern periphery, all the way into today's Spain.

In 711 AD, Islamic armies invaded the Iberian Peninsula, which eventually established Moorish

rule. Jews of the peninsula had been suffering under the cruel rule of the Visigothic kings, who practiced forced conversion and executed those who remained "secret Jews." Those dynamics reappeared several centuries later. When Islamic armies overran the Iberian Peninsula, Jews were fighting right beside them. Under the subsequent Umayyad dynasty, Jews flourished as nowhere else. In Babylonia, they were still subject to persecution from the local rulers, but under Umayyad rule on the Iberian Peninsula, the Jews lived in a golden age. Life under the Umayyad dynasty in Moorish Spain was as good as Jews would have it until the nineteenth century.

By 1000 AD, Jews were widely scattered across Europe and the Middle East (even China.), and Córdoba (Spain) became the most prosperous center of Jewish life, and Europe's most civilized place. Until around 1000 AD, relative harmony existed between Jews, Muslims and Christians. Unfortunately for the Jews, the Christian and Islamic worlds would soon make their lives more precarious. One of the earliest expulsions of Jews in Europe was from the Rhineland in 1012. Jews did not come to the British Isles until William the Conqueror invaded them in 1066.

Violent Berber Muslims made their play for power, seizing Córdoba. When the Umayyad dynasty ended in 1036, Moorish Spain splintered into fractious petty kingdoms. In 1056 the Christian Reconquest was initiated, and Toledo was retaken in 1085. During the Reconquest, [the Iberian Peninsula degenerated into a militarized land](#), with constant wars, not only between the Christians and Moors, but the Moors became mutually hostile and warred against each other. Soldiers became more important than poets, and life became harder for Jews as well. Virulent outbreaks of Islamic fundamentalism marred the times. In 1066, Islamic preachers incited the slaughter of about 5000 Jews in Granada, claiming that they had too much influence. Although Jews generally had a better life in Islamic cultures, there were slaughters of Jews across the Islamic world from time to time, mainly in North Africa. Although Jews were "People of the Book" and had theoretically protected status, they were still a minority and held to be inferior to the Islamic overlords.

The [rise of Europe](#) as a cohesive entity took shape around that time, and the first Crusade of 1096 can be seen as the first act that "Europe" took. Europe began seeing itself as one people, united by Christian faith and white skin. By that time, the Catholic Church had become a great temporal power as well as religious institution, owning about a quarter of Europe's land. Tales were told of Christian pilgrims to the Holy Land being mistreated by Islamic people. Since Jews lived in the Holy Land also, Christians in those days barely distinguished the two. During friction between the Eastern Roman Empire and Turkey, Pope Urban II initiated the first Crusade in 1096, whipping up European Christians to go battle the Turks. As the Europeans were riled up to do battle, the soldiers made a detour before "liberating" parts of the Eastern Roman Empire that the Turks had taken. Beginning in France and soon spreading to Germany, the Crusaders engaged in what is considered the first holocaust of European Jews by Christians. In a frenzy of bloodlust, the Christian soldiers engaged in mass murders

of Jews. As many as 8000 Jews perished in the massacres.[\[46\]](#)

From that time forward, Jews would no longer be safe in Europe. There had been slaughters of Jews before, many times, but that part of the world was very violent. The massacres of 1096 were the first with a decidedly religious, anti-Jewish fervor. That first Crusade was the most successful, and was a thoroughly imperial venture that climaxed in "liberating" Jerusalem from the Muslims. Christian fanaticism fueled the fire of those marching hordes. The Crusaders laid siege to the Holy City, and when they breached the walls they massacred nearly every inhabitant. The city was bathed in infidel blood. It was an Old Testament-style bloodbath. One could not walk through the city without walking on bodies, sloshing through pools of blood and navigating heaps of severed heads. As when [Joshua's Jews laid waste to Jericho](#), the Crusaders turned the slaughter into a sacred affair, the knights "sobbed for excesses of joy" as they bathed in infidel blood, cooked up Muslims and ate them, and other wonders. Those are not "[Black Legend](#)"-ish allegations, but events proudly written up by the Crusaders and their chroniclers themselves.[\[47\]](#)

In England in 1144 were recorded the first European accusations that the Jews killed babies in their rituals.[\[48\]](#) That accusation took on a life of its own, inciting mass murders of Jews in England, especially around Crusade time. The accusation of ritually murdering children is an old one, often combined with cannibalism and/or drinking their blood. Ironically, Roman pagans accused the new cult of Christianity of the very same crime.[\[49\]](#)

While Jews were being massacred in England and France regularly, the first Jewish expulsion in France occurred in 1182 after closing the Jewish academy in Paris. While European anti-Semitism began rearing its head, the Catholic Church was becoming thoroughly corrupt. Popes were leading Crusade after Crusade, Pope Innocent III calling for the fourth Crusade in 1199. There were also minor Crusades being mounted throughout Europe. The concept of Christian armies marauding through Europe was becoming ingrained, and the idea of a perpetual Crusade took root. Christianity was becoming the polar opposite of Jesus' teachings.

By the early 1200s, the Church was thoroughly corrupt and there were attempts made at reform. The Council of Evreux in 1195 mentioned the selling of indulgences by the clergy, and bishops selling holy oil and relics. The Council of Avignon in 1209 mentions a priest who dined with his parishioners regarding their penances (double or nothing?), and priests opening taverns with a priest collar as the inn sign. Priests had families, lovers and concubines, and drank heavily, hunted and gambled with abandon.[\[50\]](#)

When the Christian Crusaders showed up in Constantinople to "help" in 1096, their Byzantine "hosts" were shocked, and saw their European "allies" as uncouth and barbaric backwoods rubes, as their most pronounced characteristics were their filthiness, fanaticism and violence.

The Hellenistic culture of the Eastern Roman Empire was far more refined than European culture.

While the Church was becoming increasingly degraded, the Islamic culture pursued a different path. By about 1200, the Islamic culture may have had the world's highest standard of living (the only "competitor" for the title would have been China). The Arabic Islamic culture emphasized learning and built some of the world's greatest libraries. The Catholic Church specialized in burning libraries. The West knows about the ancient Greek philosophers and culture largely because their work was preserved in Islamic libraries. The Catholic Church spent centuries eradicating any literature considered pagan or heretical, and all the Hellenistic writings in Europe were consigned to the flames.

The Church's intolerance would express itself quite violently after 1200 AD. Not only was the Church mounting Crusade after Crusade, its priestly ranks were filled with corruption, and Jews and Islamic people were not the only people on the Church's hit list. Because of the wholesale corruption and debauchery of European Christianity, with Crusades becoming perpetual, with gambling, drunken, philandering priests and the like, the Catholic Church did not inspire much obeisance from the flock. In France, while Jews were having a rough ride, there were two movements that tried getting back to the spiritual roots that the Catholic Church had largely forsaken.

In 1175 in Lyons France, Peter Waldo (or Valdés) sought the meaning of God, and was told by a theologian to sell what he had, give it to the poor, and follow Christ. Waldo did just that. His fervent passion for the essence of Christianity gave birth to a new religious movement. His followers were originally known as the "Poor Men of Lyons," and they eventually adopted Waldo's name, becoming Waldensians. Waldo was a devout Christian; too devout. He originally tried reforming the Church, bringing it back to its humble roots. The Church would not tolerate it, and Pope Lucius III excommunicated Waldo in 1184. In that same year, Lucius III issued a bull ordering bishops to "direct inquisitions" on heresy. The roots of the Inquisition are in Roman law, where the *inquisitio*, originally a routine act of Roman judicial investigation, degenerated into torturing confessions out of suspected criminals.[\[51\]](#) The ancient Roman practice was revived to deal with heresy. Heresy was usually nothing more than refusing to be an obedient subject of the Church.

Waldo and his movement was a thorn in the Church's side, but there was a much greater threat to the Church's religious monopoly: the Cathars. Unfortunately, there are no Cathar writings extant. Nearly all that is known about them derives from reading the attacks of Catholic scholars.[\[52\]](#)

The popularity of the Cathars and Waldensians was partly due to the Catholic Church's spiritual bankruptcy. The Cathars exceeded the austere mien of the Waldensians. Their creed was dualistic, meaning that they believed in a good god in heaven and an evil god who ran

earth. It is said that they were not really Christians, but that is misleading. A number of early Christian sects were also dualistic, such as the Gnostics. The dualistic aspect of Gnostic philosophy was older than Christianity. It can be argued that the dualistic creed of the Gnostics and Cathars was Christian in that it centered on Jesus. The Gnostics considered themselves Christians, as did the Cathars. The Gnostic philosophy antagonized other Christian sects, and the Gnostic sects lost the political battle of what Christianity would become. What is called Christianity today is merely the victorious viewpoint of the most powerful Christian sects, especially the one aligned with the Roman Empire's might. Gnostic texts were carefully excluded from the New Testament, such as the gospels of Thomas, Peter, Mary, Philip, Nicodemus and the Gospel of Truth. Dualistic thought is prominent in the Bible, especially in the New Testament, with apocalyptic struggles of good against evil becoming the philosophical underpinnings of Christian institutions such as the Crusades and the Inquisition.

[53]

The Cathars were dualistic, but so is any Christian who believes that the devil is influential on earth. In theory, there is a distinction between the two. In the standard Christian view, God created all, and Satan was a fallen angel. Satan is not a creator as such, but a corrupter. The agent of darkness that the Gnostics, Manicheans and Cathars believed in was a creator in its own right. A good god ran heaven, and a dark god ran the physical world. Theologians have spent centuries arguing such matters, but if the evil is due to Satan or a dark creator is a relatively fine distinction, and in practice, the difference is on the order of splitting hairs. How one *deals with the darkness* is all-important.

Manicheanism was a bona fide world religion, comparable to Christianity or Islam. Mani founded it in the late 200s AD, and it was an amalgam of Christianity, Buddhism, Zoroastrianism and elements from other religions. Mani pursued a consciously syncretic attempt at a universal religion. The religion he founded flourished in the Middle East and Central Asia, and even spread to China. The Manicheans practiced one of the gentlest religions. Believing matter to have inherent darkness within it, yet with God's light inside also, the Manichees killed no animals, ate no animal flesh, and cultivated melons as a staple, as they would not kill the plant to gain the melon. They even apologized to their bread as they ate it. As with the Gnostics, women had a prominent place in Mani's religion, able to become the "elect," (the priest class, but they could not take office...not being entirely free from the day's misogyny).

Christian doctrine states that souls are tainted with original sin. The Manichean doctrine stated that the only taint was from being in a physical body. The soul was untainted, and the path to salvation was through "gnosis," which means "knowing." Awakening the soul and purifying the inherent light in matter, sending it back to its source, were the goals of Manichean practice. As with all religions, Manicheanism devolved when it mistook the symbolic for the literal, or when it proposed spiritual regulations, with their inevitable dos and don'ts. Yet, a religion whose central tenet was causing no harm to living beings gets high marks, and they apparently lived by it. While the Catholic Church devolved to granting salvation to those who paid enough

money, the Manichean faith largely avoided that corruption, although the faith had the "hearers" (similar to "the flock," in Christianity) financially support the "elect" (such as the priests).

Manicheans were first persecuted by the Roman Empire in about 300 AD. They were treated worse than Christians. The totalitarian nature of Christianity could not abide Manicheanism either, and as Christianity became allied with the Roman Empire, the Manicheans, like the Pagans and others, became the object of Christian destructive zeal. Long after Manicheanism had been eradicated in the Christian world, it continued flourishing in Asia, and the religion lasted for more than a thousand years before finally being wiped out.[\[54\]](#)

The world would be a gentler place if religions such as Manicheanism were not destroyed. As with other extinct religions, the Manicheans are not here to defend themselves, and until recently, the West knew of the Manichees largely by reading Christian polemics against them, which surely did not provide a sympathetic or balanced view. Mani, unlike Buddha or Jesus, put his words on paper and tried founding a religion, although modern scholars still do not know how he exactly practiced his craft. Apparently he could tailor it to his audience, be they Buddhist, Christian, or of any religion. Manichean missionaries, partly because of their syncretic views, were more successful in their recruiting efforts than their Christian counterparts. Christianity prevailed largely due to brute force and the temporal power it cultivated.

The Cathars followed in the tradition of Gnostics and Manicheans. The Cathars followed Jesus' living example the best they could, and took it to greater extremes. Cathars would not willingly kill any living thing, and the most accomplished Cathars, the *Perfecti*, fasted three times a year for forty days each and were celibate, similar to the Manichean *Electi*. The Cathar faith was an ideological descendant of Manicheanism. So were the Bogomils and Paulicians. The Cathars' most devout members would not even eat eggs, milk or cheese, "unclean" foods that were associated with procreation. The *Perfecti* lived the simple and austere life that Christians imagined Jesus lived, and their no meat and no wine policy took it further than Jesus did. Again, no Cathar writings have survived the Inquisition's bonfires. Cathar critics stated that the Cathars did not even believe in procreation, which led the great Inquisition historian Henry Lea to state that the Church's attack on the Cathars was probably justified because a few generations of Catharist abstinence would extinguish the species. The Manicheans apparently discouraged having children, although marriage was fine for the "hearers," and even keeping mistresses, as Saint Augustine did when he practiced the Manichee faith.[\[55\]](#) Procreation was discouraged but not *forbidden*, particularly as Manicheanism was a pacifistic religion. They indeed were austere ascetics, but there is more to intrigue about their faith than there is to deplore. Manicheans considered themselves Christian.

It is possible that their critics, to make them seem crazy, exaggerated their austerity. The

Western mentality for millennia has been a bizarre and fanatical denial of the flesh, as demonstrated by the [self-tortures](#) that priests and nuns inflicted on themselves. It is perhaps *too* convenient that the Cathars were accused of autogenocide as a rationale for eradicating them.

The Cathar faith apparently came from the Balkan region, probably as a side effect of the Crusades, arriving with returning soldiers.[\[56\]](#) The Cathar faith spread rapidly in France. The *Perfecti* attained an outward holiness that made all priestly piousness pale beside it.

Catharism and Waldensianism spread like wildfire throughout France. In parts of France, half the population became Cathar. The Catholic Church saw that development as a threat. Various analyses justify the Catholic Church's position toward the Cathars as "defending" itself from Cathar attacks, or defending the entire European worldview from such an affront. It appears that the "threat" was more like the threat the Washington electric companies felt when [Dennis Lee](#) appeared on the scene with a superior energy conservation technology. The main Cathar threat was that the Catholic Church's pews would become empty, and their coffers would no longer be filled. Much of the spiritual and cultural theorizing is probably a smokescreen to disguise the dictates of raw power. The Cathars were a threat to the racket.

Innocent's strategy was one that businessmen can appreciate: put cement shoes on the competition while simultaneously marketing an ersatz version of their product. In the span of a few years, Innocent authorized the establishment of two new priestly orders. He authorized the Franciscans in 1209, and in 1214 the Dominican order was founded, officially approved by Innocent's successor in 1216. Those were the first two mendicant orders founded by the Catholic Church. As with the Cathars and Waldensians, the priests of the new orders took vows of poverty. In 1204, Innocent tried getting the Cistercians to preach against the Cathars. The Cistercians were founded during the first Crusade, in 1098, and were the dominant order of the 1100s. They originally had ascetic ideals, but were not mendicants, and when 1200 rolled around their mission had changed significantly. Forty-eight knights joined the Cistercian order in 1112, led by the man who became Saint Bernard. The notion of the oxymoronic monk-like, chivalrous knights, already on the rise, became more popular. In 1119, the Knights Templars were formed in Jerusalem. The Cistercians were not the ideal monks to counter Cathar preachings. Dominic tried bringing Cathars back to the Catholic fold in 1205.

Dominic had limited success, but his order became the Catholic Church's priestly army. In 1208, Innocent called for a Crusade on France to stamp out the heresy of Waldensians and Cathars. In 1209, the Crusade's purpose was made evident when the Catholic army, led by the Abbott of Citeaux, Arnauld-Amalric, surrounded the city of Béziers. When asked how to distinguish faithful Catholics from heretics, the Abbott allegedly told his Christian soldiers to "Kill them all; God will know his own."[\[57\]](#) The army, so instructed, proceeded to kill every resident of the city. Estimates range from 7000 to 20,000 people dying in that slaughter.

The irony can be overwhelming. The Cathars were devout pacifists. They rarely put up any resistance. Many fled across Europe, making the murderous Christian task more difficult. Early Christians in the Roman Empire were also noted for their pacifistic non-resistance to Roman violence. A thousand years later, the Christians were the butchers, doing the same thing to those non-resisting Cathars. Burning the Cathars alive was a favored method of dealing with them, especially the *Perfecti*. The awesome violence that the Crusading army inflicted on the local populace was a method of terror, a timeless and effective method of pacifying the population, making examples out of the disobedient. The Albigensian Crusade waxed and waned in France for decades, and entire regions were depopulated. Perhaps a million people died in the Albigensian Crusade. The massacre at Montsegur occurred in 1247, which nearly put the last nail in the coffin of Catharism. Crusades were nearly a constant in those days, marching back and forth across Europe and into the Holy Land, in an unending orgy of bloodshed. Jews were being slaughtered, but Christian was slaughtering Christian also, something Jews and Muslims had difficulty comprehending at times. Jews were banned from France in 1254, and expelled from England in 1290.

One of Innocent's last acts was convening the Fourth Lateran Council in 1215, perhaps the single-most ambitious conference in Christian history. Innocent tried reforming the church, restating the faith, calling for a new Crusade, and making annual reception of Holy Communion and confession a requirement for all Catholics. Innocent also raised Church taxes, condemned the Waldensians and Cathars, and made a further definition of heresy and how to deal with it. One of that council's edicts was forcing Jews and Muslims to wear clothing that marked them as non-Christian, something the Nazis would do much later. Although Innocent was responsible for initiating endless bloodshed with his Crusading zeal and political machinations, he did not initiate the Inquisition, as such. A series of bulls by Pope Gregory IX in the late 1220s and early 1230s further established the concept of the Inquisition, and by 1260 the Inquisition was rolling along. Dominicans and Franciscans usually ran the Inquisitions. There was not yet a central Holy Office as such, but the Inquisition was known and feared. Mendicant friars became the scourge of heretics. The almost total annihilation of Cathars by 1250 had eliminated the direst threat to the religious monopoly, and the Inquisition became a standard feature throughout Europe, where it was needed to keep the restive flock in line.

During the second half of the 1200s, Dominican monk Thomas Aquinas wrote what many consider the greatest works in Catholic history. His work also further solidified the Inquisition's philosophical underpinning, and helped set the stage for later witch hunts.

The Catholic Church may have helped hold Europe together back then, similar to Constantine's strategy of using Christianity to hold the Roman Empire together, with the Catholic Church being Europe's only unifying institution. The Church often vied with kings and emperors for power, in an intricate dance that characterized Europe for centuries. Charlemagne formed the Holy Roman Empire during the 700s, which became an attempt to revive the union of Church and state that Rome had for a short time. For the next thousand

years, European nations and the Catholic Church had a wide spectrum of interaction, the Church often bringing the rulers to heel, but eventually losing power struggles with the Protestant Reformation.

The fate of European Jews was often the subject of European caprice. When times got bad, the Jews suffered for it. The 1200s, for all its bloodshed, possessed a pastoral calm compared to the 1300s. In the 1300s, warfare, famine and disease [swept back and forth across Europe constantly](#). The Black Death swept across Asia from China. It killed tens of millions of people, with a third of China, a third of the Muslim world and a third of Europe dying, producing the greatest carnage in Europe in 1348-1349. Europe's response to the Black Death was blaming Jews for introducing it. Tens of thousands of Jews were burned alive for "bringing" the plague to Europe, as well as lepers and other outcasts. Church policies fomented anti-Semitism, but when the mobs began murdering Jews, Church officials often tried preventing them. Church officials abetting anti-Semitism were usually not the same ones who tried saving Jews from the mobs.

Franciscans were the scourge of Jews in those days. Jews were restricted from numerous professions, but in one profession their religion and the Christian religion meshed. According to the Biblical code that guided Christians, they could not lend money and earn interest. The Jewish code allowed them to earn interest on money lent to "strangers," which came to mean non-Jews, and that was how the Jews became bankers and the source of many conspiracy theories.[\[58\]](#)

With all the anti-Jewish violence in Europe, European Jews fled to where they could, usually out of Christianity's reach. It was not always nice for them, but present-day Spain was the safest place in Europe for Jews during those early anti-Semitic massacres. Under Moorish rule, Jews often flourished. The Reconquest of the Iberian Peninsula took place over several centuries. Jews who lived under Moorish rule for centuries suddenly found themselves the new subjects of Christian rulers. As one more Moorish city-state fell to the Christian armies, Moors and Jews fled to another Moorish city-state, or tried fitting in under the new regime. With the degeneration of Moorish rule in Spain, sometimes Jews felt they had a better deal with the new Christian overlords, and sometimes they did...for awhile.

Dominican priest Vincente Ferrer preached many hysterical anti-Semitic diatribes in the late 1300s in Seville, leading to riots and mass murders of Jews in 1391. The slaughters spread out and dotted the Iberian Peninsula. One option of Jews finding themselves under Christian rule was converting to Christianity to stay alive. It amounted to conversion by the sword. Previously, the Jews often chose the sword, but in 1391 something broke in them, and many chose conversion. Those "New Christians" were called *conversos* or *marranos*, *marranos* being derived from the Spanish word for swine.

A significant motivation for the mass murders of Jews that peppered Europe was greed. When

Jews were murdered, their property was taken. Many of those inciting the massacres got rich from Jewish plunder.

After "conversion," many Jews strove to hide their Jewish heritage. For Christians, conversion still did not take Jews off the hook. The persecution became racial rather than religious. Jews were white people too, and it was not easy to distinguish them from other Europeans, especially in Spain. When the racial strategy proved unworkable, the strategy then became ferreting out New Christians who secretly practiced their Jewish faith. Throughout the 1400s, Jews in Spain were oppressed, with riots and massacres. Being a *converso* was no guarantee of safety, and some riots were specifically directed toward *conversos*. It escalated throughout the century, the Christian armies kept gaining ground, and Moors were pushed to the southern end of the Iberian Peninsula. The last remaining Moorish city-state was Granada.

In 1474, Ferdinand and Isabella ascended the throne, and *idea* of Spain grew from their rule. The peninsula was under one rule during the Roman days, but that was a thousand years previously. In 1480 Isabella began the Spanish Inquisition, and life got much worse for Jews. The Inquisition specifically targeted *conversos* who secretly practiced their Jewish faith. Many Jews *did* keep their faith in secret, which was understandable. The Inquisition's job was hunting down those "traitors." The Inquisition's fires then began burning across the Iberian Peninsula, consuming Jews by the thousand.

Jews were not Europe's only oppressed group. As the Spanish Inquisition heated up, witches were burning from one end of Western Europe to the other. The Inquisition had a hand in the witch-hunts, and could feign clean hands. The Church never officially burned a heretic. They would condemn them and "relax" them to secular authorities for their punishment. Similarly, the Church wrote the handbooks for finding and dealing with witches, and their treatment of heretics was adopted to various degrees in the witch-hunts. While the Inquisition did not play in England, burning witches did. England had expelled its Jews centuries earlier, as had France, so Jew-hunting was not a sport for them. About 85% of the witches executed were women, and many were healers of some kind. The witch-hunts were a women's Holocaust. There were instances where villages committed effective suicide by killing *all* of its women.

In 1492, Granada fell to the Christian armies, ending several centuries of Moorish rule on the Iberian Peninsula. When the Spanish armies controlled everything on the Iberian Peninsula except for Portugal, the Spanish sovereigns issued a new decree: Jews faced the choice of either conversion or expulsion. The numbers for Spain's Jews were 160,000 expelled, 50,000 converts and 20,000 deaths.[\[59\]](#) Some estimates go much higher, with 400,000 Jews leaving Spain. During the 1400s, Jews were expelled throughout Europe: Vienna, 1421; Cologne, 1424; Bavaria, 1442 and 1450; Milan 1489; Florence and Tuscany, 1494, and many other places. Although Poland had anti-Jew riots in 1348-49 (Black Death) and 1407 and 1494, by 1500 Poland was considered the safest place in Europe for Jews. Most Jews expelled from Spain went to the Ottoman Empire, where the Islamic culture welcomed them. About 10,000

went to Italy, but [Spain invaded Italy during the 1500s](#), and those Jews again ended up in the wrong place.

When Jews were expelled, ending up in a region already filled with Jewish refugees, that would often trigger expulsions in that region also. The Wandering Jew became a part of the folklore about that time. In 1517, Martin Luther initiated the Protestant Reformation with his Ninety-five Theses. In the long run, it probably helped Jews by dividing Christians. However, the early protestant theologians were not kindly disposed to Jews, Martin Luther perhaps the worst of them, with his 1543 pamphlet "On the Jews and their Lies." His diatribe is seen as a stepping-stone to the Jewish Holocaust.

Virtually all of Western Europe was hostile to Jews, and those who did not flee to Islamic lands went to Poland. During the 1500s, the Jews thrived in Poland and nowhere else in Europe, except for some in Southern Italy. In 1541 in Venice, the first European *ghetto* was formed. The Jews had lived in segregated living before in Europe and in Islamic lands, but the Venetian ghetto was a kind of Jewish prison. Some historians have questioned why the Jews accepted their fate in Venice, while others feel it was understandable, after all the demoralizing events during the previous centuries, climaxing with the mass murders and expulsions from Spain, and further expulsions and murders when the Spaniards conquered Northern Italy. There was a certain passivity and acceptance of their condition. It was partly due to their religious convictions. It was also an attitude remarked upon as they were being herded to their deaths in World War II.

Wealth, Jews and the Age of Colonialism

In 1493, the [New World's rape began](#) with [Columbus' second voyage](#). Although the Crown had specific laws forbidding Jews from sullyng the New World with their presence, it is estimated that of the 200,000 European residents in Mexico by 1570, a third were converted Jews and another third were converted Moors.^[60] That was a logical place for them to flee, but the Inquisition was not far behind, hunting for crypto-Jews and Moors. More Jews fled to the Islamic world. Poland was the last Jewish haven in Europe. [Charles V](#) was the Holy Roman Emperor and King of Spain when Cortés was [conquering the Aztecs](#), while Martin Luther was making protestant noise. Charles V was a Hapsburg and inherited a vast realm, and the Conquistadors were securing a much vaster one. Through the political and royal machinations of Europe, Charles ended up with the Netherlands as part of his realm. The Netherlands was full of merchants and tradesmen, and was prosperous.

Charles issued the edict condemning Martin Luther's work, which Luther defended at the Diet of Worms in 1521. Charles did not stop the Reformation from happening. The Reformation and Counter Reformation were very bloody affairs, with wars that lasted for generations.

Charles was Europe's most powerful ruler in 1519, when he bribed his way into becoming the Holy Roman Emperor as well as being Spain's king. In 1520, he became the King of Germany. Just as the first [magnificent treasures arrived from Mesoamerica](#), giving a hint of things to come, Charles was reaching his power's peak. Charles' hegemony was short-lived. Wars, politics and the Reformation assailed his empires, and when he stepped down in 1558, all he gave his son was Spain and the Netherlands.

The Reformation found fertile soil among the educated mercantile class of the Netherlands. Charles tried stamping it out by brining the Inquisition there in 1522. For more than forty years the Inquisition had raged in Spain, consigning thousands of Jews to the flames while keeping the rest terrified. Since they were mere Jews being burned alive, most of Europe did not get excited about it. When The Inquisition came to the Netherlands however, putting *real* Europeans to the question, that was going too far. That was when anti-Inquisition polemics really began in Europe. That was when the Inquisition's popular image was formed, that antihuman organ of terror and oppression. It had always been that, but it was not until Protestants began being burned alive that Europeans got angry. The Spanish and Dutch Inquisitions were more nationalistic than religious, not really backed by Rome.

The Reformation woke up Rome, and they revived the Inquisition in 1542, and for the first time made a central governing office to run it, called the Holy Office of the Inquisition. Before that, the inquisitors operated without a central office coordinating their activities. The Holy Office was initially relatively tame, and largely confined to Italy for a dozen years. The Inquisition became more ambitious in 1555, with Pope Paul IV recommending hunting down heretical bishops and cardinals. In 1559, the *Index of Forbidden Books* was first published, winning the Catholic Church further infamy.

In 1566, the Dutch began rioting against the oppressive sway of the Catholic Church and Spain. That began a war that did not finally end until 1648. The Spanish war against the Netherlands was a major factor in [bankrupting the Spanish Crown several times by the 1650s](#), and helped set the stage for Spain's decline. For opportunistic reasons, England began helping the Netherlands in 1585, and in 1588 prevailed over the Spanish Armada. By 1600, the Netherlands [was free of Spanish domination](#). Jews flocked to Western Europe's only haven, and in 1615 were legally allowed to stay if the province would have them.

Also, Jews migrated to nearby Hamburg, on the periphery of the Holy Roman Empire. When the Thirty Years War broke out in 1618, Jewish financiers helped the Hapsburgs. The Thirty Years War was Europe's most brutal war to that time. Europeans had demonstrated for many years in the New World and elsewhere that they were masters of earthly violence, and honor and rules made no difference. The goal was winning at all costs by any means. The Thirty Years War gave new meaning to war. The concept of total war, of killing the enemy at all costs and surviving to fight the next day, put down deep roots during a war that lasted thirty years and killed four million people, half of them civilians, most of them Germanic people.

Jews were experts on resourcefulness, surviving on practically nothing, and that resourcefulness came in handy in fighting that war, and Christians put aside their enmity toward Jews if they could provide the resources to fight and survive. Their ascendant role as financiers, managers and procurers of resources also won them enemies, and there were still Jew slaughters and other abuses, but they became an integral part of the region's economy.

The Dutch began their imperial expansion in about 1600, sailing the high seas and [making the Spanish pay whenever they could](#). The Dutch were the first great [mercantile](#) colonial power.

The Dutch Republic of the United Provinces was Europe's first republic, and the heart of European liberalism. That did not mean that they were gentle colonizers. French pirates had been attacking Spanish ships since they first began coming home with New World plunder. England got into the game in the late 1500s, and [the Dutch joined them in the early 1600s](#). That began the [European scramble for the world](#). Whether it was in Asia, the New World, Africa or the South Pacific, the English, Dutch, French, Spanish, Portuguese, Swedes, Danes, Russians and others fought over who would loot the world. Some came to the game later than others. Germany and Japan were the two biggest latecomers, and when they found few foreign lands and people that they could call their own, humanity experienced two colossal wars.

The first two centuries of Europe's New World hegemony was the most wasteful plunder of all time. [Killing off nearly all the natives of a hemisphere](#) was bad enough, but what did Europe gain from it? Europe supposedly gained wealth through its colonial exploitation. That was the reason they did it. The benefits that Europe derived from the first two centuries of the New World's plunder, a plunder paid for with the lives of perhaps 70 million natives, were: gold, silver, sugar, tobacco, dyes and furs.

Adam Smith's *The Wealth of Nations* is considered the first major economic treatise ever written, and was published in 1776, long after the initial plunder was over. Smith wrote that a [gold rush was one of humankind's stupidest events](#). Gold and silver are not wealth, and particularly back then. About the only intrinsic value that gold and silver had was ornamental. Making silver eating utensils was the only practical use of the metal until modern times, when it began being used in industry. Gold had even less practical use than silver. The only reason gold and silver were perceived as valuable was their use as money. Anything can be used as currency, because currency is only representative of wealth, not wealth itself. The only thing that made scarce metals valuable was their scarcity.

[Spain's colonial experience](#) is a perfect example of the uselessness of mining gold. There was a transfer of wealth that occurred when Spain brought back that gold and silver, bought with the lives of tens of millions of natives. Some Spaniards got their hands on the goods of other European nations, as they honored the "precious metal" as a form of payment. Spain's elites lived relatively lavishly for a short while, although [Spain as a whole declined](#), and it was arguably worse off in 1600 than it was in 1500.

There is little intrinsic value in any currency. Native Americans sometimes did similar things in their ignorance. Wampum belts were considered wealth in some societies, but making them was a waste of time. The less time and effort spent creating currency, the better off the society is. The Aztecs were a little better. They used chocolate beans for currency. They could make a drink out of the chocolate beans, so there was intrinsic value in the currency. Ears of corn would have been the ideal currency in Mexico, and it was. The Aztecs largely had a barter economy, and something as easily handled and relatively small in value as corn (per ear), became an ideal unit of exchange. People could eat the money, which is the ideal currency. In a barter economy gold is virtually worthless, and was one reason the natives could not understand the Spanish obsession with gold.

Money is only the scorekeeper, not the game. When the rigging the scoreboard becomes the game, the system is broken. All gold rushes reflected the ignorance of the societies engaging in them. They ultimately impoverished the societies that had them, as the net result was wasting the effort of one segment of the population (the miners, refiners, etc) so they could steal from the other. The only way Spaniards were able to avoid an even worse economic collapse was [enslaving natives to do the work](#). They first stole the results of millennia of native effort in creating their gold artifacts. The Spaniards melted that all down, destroying all the artistic value. Then they enslaved the natives as millions of them died in the mining operations. If the Spaniards had to dig the gold, the 16th century gold rush would not have happened. Millions of natives paid with their lives so Spain could leech off its neighbors for a brief time.

The other main product the Spaniards received from the New World was dyes. Again, what was the intrinsic value? Virtually none. Dyes are sheerly cosmetic, providing no real wealth. Enslaved natives killed small insects for their bodily juices that made the red dyes. Thousands of insects would be killed to produce an ounce of that dye. Again, it was a prodigious waste, but if there were natives to enslave and insects to kill, they could give their lives to producing Spanish baubles. The materialism of that age echoes to the present day, with the rampant consumerism that plagues America and is infecting the world. More than 90% of the export "value" from the New World was gold and silver in that first century of "discovery."

What was the other great boon from those early colonial days? Sugar. The Portuguese specialized in that more than the Spaniards, especially when their plunder of [Brazil did not find any El Doradoes](#). The Portuguese specialized in [producing sugar](#). What good is sugar? There has rarely been a substance more damaging to human health than [refined sugar](#). All one can say for refined sugar is that it tastes good, while greatly contributing to diabetes, [tooth decay](#) and obesity. Refined sugar is more of a drug than anything else, and provided less than zero benefit for Europe's health.

Who did the Portuguese recruit to raise that sugar? When they first began raising sugar in Brazil, they enslaved the natives to work on their plantations. The natives died off in about a generation, just as they did in the Caribbean, under the slave conditions the Portuguese subjected them to. As with the Spanish gold mines, silver mines and plantations, the Brazilian natives were considered expendable assets. When the natives were exterminated, the Portuguese began [importing African slaves](#). The sugar trade [brought more African slaves to the New World than anything else](#). The natives were all killed off, and tens of millions of Africans lost their lives to ensure that Europe was well stocked with a drug that ruined their health, but tasted good. Today the sugar industry devastates Northeastern Brazil, with about thirty million people enslaved to the sugar system. Growing sugar is also devastating to the soils where it is raised.^[61] The only place in the sugar empire that has tried beaking the sugar-growing habit is Cuba.

When England, France and the Netherlands came to the Empire Game in the 1600s, what were the benefits of their colonialism? The first thing they always looked for was gold. [Francis Drake](#) became England's richest private citizen by his surprise plundering of the Spanish Empire's Pacific ports, filling his ship with silver bought with countless native lives. The first Englishman who looked for gold instead of stealing it was [Martin Frobisher](#), who hauled hundreds of tons of fool's gold to England. [Walter Raleigh](#) was after gold too, a quest which cost him his life.

When the English established their first military beachhead in the New World at [Jamestown](#), the natives kept them alive with their corn and other food, which was the typical situation with all European invasions. If not for native food and help, the Europeans would have always died. The first thing the Jamestown invaders did was look for gold. As with Frobisher and Raleigh, they did not find any. Something had to economically justify the invasion, and it was discovered, for another great "benefit" to Europe: tobacco. Tobacco was the primary export from Jamestown and the region throughout the 1600s. As the Portuguese did in Brazil, the English imported captured Africans to get the work done. Tobacco brought Africans to America, to grow another [addictive substance](#) that ruined European health.

Only one product came to Europe in those early colonial days that had any genuine value: [fur](#). Fur was used as clothing to conserve body heat. Humans are naked, and have stolen the fur from animals ever since they migrated from their natural range in the tropics. In all the New World's plunder during those first two centuries, it was the only item of any intrinsic value. All the others had illusionary value, and in the case of gold, silver, sugar and tobacco, they ultimately damaged European society. For that, a hemisphere was depopulated and another continent's population (Africa) was devastated. When the French joined the game in North America, it sought the fur trade, and its early "help" [completely extinguished the Huron tribe](#).

When the United States got into the act, trappers soon followed the [Lewis and Clark](#)

expedition, completing the extermination of nearly all fur-bearing animals in the Northern Hemisphere. That fur "business" was engaged in by some of most ruthless and primitive humans of all time.[\[62\]](#) As with most interactions between indigenous and European cultures, the result of the fur trade was virtually an unmitigated disaster for the natives. The fur trade spread drunkenness, disease and viciousness throughout the western lands, and early robber baron capitalists such as John Jacob Astor became rich from the process that ultimately [swindled the natives out of their lands and lives](#).

Although the fur business was the only one that created some actual "wealth" for Europe, it was short-lived wealth, as the animals that provided the fur were driven to extinction. Beaver-skin hats were the rage, which drove the beaver to extinction in most of the United States. Bison robes were another short-lived fashion item, which was a native "industry," while the natives and bison lasted. "Wealth-producing" activity that is really a short-lived plunder is not really wealth producing, something that [Carl Sauer](#) remarked on. It is stealing wealth from future generations, and over time is a net reduction of wealth. The issue of creating or husbanding sustainable resources was completely alien to European thought. It is not being practiced to any degree of significance even today. Throughout the long centuries of the New World's rape, there were few observations that plundering resources like there was no tomorrow, would guarantee that there was no tomorrow. Ironically, one of the few to observe it was the first on the scene. Columbus, himself the architect of the hand-severing gold tribute system, said that the reckless squandering of native life by the Spaniards on Española would be detrimental in the end, [because dead slaves cannot perform any work](#). For the next four centuries, his voice was one of the few in the wilderness.

How much "benefit" did Europe receive from all that New World booty? Europeans had their teeth rot and developed diseases from the sugar, but it tasted good. They enjoyed tobacco; dying of the diseases it gave them. They had their economies harmed and in some cases destroyed by relying on the influx of gold and silver, thinking it was wealth. They wore fashionable and useful fur, while the fur-bearing animals lasted. They had natives make dyes that made fabric different colors. That was about it.

There was also another industry, although relatively minor as far as an export business: the forest "products" business. The forests were chopped down with abandon, especially in North America. The eastern United States was [deforested](#) as the white man's "civilization" progressed across the continent. The New World tropics have been gradually deforested, largely to produce export crops such as sugar, bananas, beef, coffee, and the trees also became an export crop as they were chopped down. A few rich landowners (mainly large corporations today) got the benefits, the people who did the work became virtual slaves to the system, the environments were devastated, and the white people enjoyed import crops such as sugar, bananas, coffee, cocaine, etc. The disaster continues today. Bringing the white man's ways was a disaster for the natives, but the white man benefited, somewhat.[\[63\]](#)

For those who came to the New World in those early days, they had other benefits that did not accrue directly to Europe. The Spanish soldiers got the dream of a lifetime as they raped every native woman they could. If it was not rape, they had harems of as many as eighty women for one man. They enjoyed the benefits of native slaves and concubines, while they lasted. The sexual relations between the Spanish soldiers and natives were virtually never romantic love. They were not relations of equality. The Spanish soldiers were exercising the conqueror's prerogative. They set themselves up as lords on the native backs. The English "settlers" stole the land from the natives, something that [their American descendants excelled at](#). They killed off countless [bison](#), [passenger pigeons](#) and fur-bearing animals while they lasted. They deforested many millions of acres in the name of "progress." Stealing native land, and enslaving and raping the natives were the "benefits" to the settlers. In addition, more than ten million Africans "migrated" to the New World in chains, while perhaps more [than thirty million Africans](#) did not survive the process.

Europe had so many wars that they had names such the Hundred Years' War, the Thirty Years' War, the Ten Years' War, the Seven Years' War, and the Seven Weeks' War. Other wars were named the Wars of the Roses (an English civil war which lasted 30 years, right on the heels of England's Hundred Years' War with France), King William's War, Queen Anne's War, King George's War, the War of Jenkins' Ear, the Carnatic Wars, the Crimean War, the Franco-Prussian War, The War of Austrian Succession, the War of Spanish Succession, the War of Polish Succession, the War of Bavarian Succession, the War of the Devolution, the Wars of Religion, the War of the Grand Alliance, and the Napoleonic Wars. There were five major Crusades mounted by the Catholic Church, with numerous smaller Crusades, and the [Albigensian Crusade](#). Later, Crusades became something that secular leaders could mount. Holy Roman Emperor Frederick II led a Crusade, only to have the Pope declare a Crusade on Frederick. Later, King Louis IX of France mounted two Crusades.

Most of the bloodshed occurred in wars fought between the European powers on European soil. The Thirty Years' War and the French Revolutionary and Napoleonic Wars killed about nine million people in total, and nearly half were civilian casualties.[\[64\]](#) Others on that list were fought abroad, as the powers vied for the right to pillage the world, as with the French and Indian Wars, which included the wars of William, George and Anne. Then their imperial descendants fought their own wars, as with the Boer War. The European powers also had internal wars, such as the French Revolution, the English Revolution, the Russian Revolution, and the Revolutions of 1848 (numerous nations). Their colonies had wars to break free from the mother countries, as with the Mexican Revolution, the American Revolution, the [Haitian Revolution](#), the many [Latin American revolutions](#), and in the postwar years of the 20th century, there were revolutions throughout the colonized world.

The United States is Europe's most accomplished descendant. Since the Revolutionary War, the United States fought the War of 1812, constant wars against the [native population](#), pushing

the survivors across the continent. America also fought [the Mexican-American War](#), the [Civil War](#), the [Spanish-American War](#), and numerous armed interventions throughout Latin America, as [Smedley Butler](#) commented on. Since World War II, the United States has fought the Korean War, the [Vietnam War](#), the [Gulf War](#) and numerous smaller conflicts, such as bombing Laos, Cambodia, Libya, [Afghanistan](#), Sudan and [Yugoslavia](#). The United States invaded Grenada and [Panama](#), and helped overthrow the governments of [Guatemala](#), [Iran](#), [Chile](#) and dozens of other nations. The U.S. financed the [Indonesian genocide in East Timor](#), brought the slaughter of Cambodia into being, and financed slaughter in places such as [El Salvador](#) and [Nicaragua](#).

Finally, of course, there were two World Wars to top it off, followed by a forty year Cold War, and we may be heading for our third World War, one we may not survive. The current "[war on terror](#)" looks a lot like World War III's beginning. Some have called this period of global European domination the 500-year Reich. If humanity survives the coming transition, historians may look back to the white man's millennium of 1000 to 2000 AD and call it "The Thousand Year War." There were far more than 100 million war deaths in the 20th century, by far history's most violent century. The 19th century is a distant second at about 20 million deaths.[\[65\]](#) About 90% was initiated or performed by white men, nearly all of them Christians.

While some Jews enjoyed their lives in the Netherlands, and resettled in the New World and elsewhere, the great magnet of Poland drew the world's largest concentration of Jews. It did not last forever, however.

In 1648, the Thirty Years' War was ending, and Poland was feeling the strain of thirty years of war. Then the peasants were led to an uprising that targeted Jews. As usual, a power-hungry aristocrat manipulated the peasants to kill Jews, which led to tens of thousands of Jewish deaths, performed by peasants and Cossacks. That time the Jews could be "blamed" for their fate. The Jews had become prosperous middlemen and financiers, and managed a system that exploited the peasants. The peasants took it out on Jews, aggravated by elite manipulation. Many Jews fled west, and the English let some in, the first time in more than 350 years. They also fled to the Netherlands, Germany and near Strasbourg, part of present day France and part of the Holy Roman Empire then, the same empire that slaughtered the Jews around 1300 in numerous massacres, driving them to Poland in the first place.

When the Crusading armies took that detour in 1096 and massacred several thousand Jews on the way to the Holy Land, one observation was that those who committed the slaughter were not trained soldiers, but more like rabble, and they could not be controlled or kept from their actions. The slaughter was engaged in by Europe's lower classes, who found a way to vent their frustration on their hierarchical competitors.

Jews were usually slaughtered by mobs. However, the elite created the intellectual framework

that justified the murders. Thomas Aquinas wrote the influential works that further set the stage for the Inquisition. Other high-ranking Catholic officials wrote and published various treatises. The official manual for witch hunting was the *Malleus Maleficarum*, published in 1488. Pope Innocent VIII wrote the work's preface, giving it papal approval. The framework for witch-hunting was developed by elites, but common people carried out the oppression. Most of the "witches" who died in those years were poor, although as there was money in it from confiscating the accused's property, the accusation began targeting people of higher economic status. Their accusers were also poor.

The "investigations" and sentences were carried out by officialdom, but the executions of witches, heretics and *conversos* were often attended by mobs of average folks, in an often-festive atmosphere. People would come from miles around to watch the executions. In America, when they had public executions, even [public lynchings](#), and the people came from miles around, sometimes undertaking great journeys to witness the executions. Why? Usually those being executed came from the same social strata as those watching them. Witches, heretics and Jews were not dying for anything that anybody would call a crime today. Those who eagerly watched the executions bore significant responsibility for those people's deaths. The elites who invented and ran the system also bore responsibility.

If I [had joined the Air Force Academy](#) and become a pilot, I may have dropping bombs onto Iraq, wiping out one of their water treatment facilities, which America specifically targeted during the [Gulf War](#). Wiping out one of those water treatment facilities led to the deaths of thousands of children. If I had done that, how responsible would I have been for the deaths of those children? How responsible would my father have been for those deaths, influencing me into believing that being a soldier was what turned me into a man? How responsible would the person have been who fueled my plane? How about the one who loaded my bombs? How about my commanding officer? How about George Bush? How about the crew who built my plane at the defense contractor's factory in America? How about Saddam Hussein? How about [Winston Churchill](#), who was an integral part of Britain's colonial exploitation of that region many years ago, setting in motion dynamics that are still playing out? How about the media reporters and others who played a part in the [disinformation campaign](#) by the United States government, uncritically repeating the story of the Iraqi [incubator incident](#) and [George Bush lying about Iraq's intentions for Saudi Arabia](#)? The media should have known better, given the government's record of lying to the public, especially regarding matters of warfare. How about all those mothers and housewives around America who tied yellow ribbons around trees, waved flags and screamed, "Support our troops!"? How about the 90% of American citizens who approved of what we did to Iraq? How about me, filling my gas tank with cheap gasoline, partly bought with the deaths of those Iraqi children?

A lawyer's response to that list might be interesting. Human beings do not have the capacity to rationally assess "responsibility" for those participants I just mentioned. Does that mean they are not responsible? The person buying cheap gasoline is not as responsible as George Bush

was when he lied to the public about Iraq's intentions regarding Saudi Arabia, [stonewalled Iraq's attempts to negotiate a withdrawal](#), and authorized an attack that amounted to biological warfare, initiating a series of events that has taken more than a million lives in Iraq so far. The person buying that cheap gasoline still has *some* responsibility. The public cheering the post-war parades has *some* responsibility for it. In order for the system to work as it does, it needs willing participants. Just as the [cancer racket needs lemmings](#) marching into the oncology wards, if the American public did not cheer and march to war, there would be no war.

The masses bear *some* responsibility, and arguably nearly all of it. Part of my motivation for pursuing free energy with [Dennis Lee](#) was eliminating the industrialized world's dependence on Middle East oil. I foresaw what is happening in Iraq today, and far worse (which may yet come to pass), when I was a teenager. I have devoted my adult life to preventing what is happening in the Middle East today. If there is any American *not* responsible for what is going on Iraq today, I must contend for the honor; yet, nearly every time I put gasoline my car, I think about those dying Iraqi children. I think about the bloodshed in [Nigeria](#), [East Timor](#) and elsewhere so the oil companies can keep pumping that cheap oil, and we can have cheap gasoline. I know that I bear *some* responsibility what is happening in Iraq today.

The net can be cast much wider than America. All of those so-called diplomats at the United Nations, supposedly representing the people of their nations, nearly all knuckled under to United States and British pressure. If the diplomats at the United Nations had any spine, there likely would never have been a Gulf War, Iraq would have negotiated a withdrawal, and all those Iraqis would not have died. How about the people in those nations, whose representatives acted so cowardly? People can talk about elites all day long, and how they do not really represent the people of their nation. It is a Political Science 101 concept that every government, to some degree, needs the consent of the governed in order to exist. Using that perspective, one it is difficult to deny, every person on earth bears *some* responsibility for what is happening in Iraq today.

Being responsible does not mean feeling guilty, not guilt in the way the West defines it. The root of the word responsible means being able to respond. My goal with making the case for our responsibility is getting across the idea that we can all *do something about it*. Some are in better positions to act than others. It is within each of us to decide what *we will do*. Just *not cheering the violence* would be a big step for most Americans. What goes around comes around. Those who today rationalize the death and destruction in Iraq as a noble undertaking, or heap all the responsibility onto Saddam Hussein's shoulders, will one day, usually in another lifetime, have the roles reversed, suffering and dying while others look on, rationalizing their fate while benefiting from it. Then they may realize that killing, exploitation and destruction are never "justified."

This topic will end with what Noam Chomsky has said on this issue, from a "rational" perspective. Chomsky says that in the area of warfare, for instance, those in society that look

at the violence and atrocities with clinical detachment, equanimity and apathy bear a great burden of responsibility for Hitler and others like him coming into power. Hitler could not appear on the scene if it were not for the complacent acquiescence and complicity of the masses.[\[66\]](#) It is easy to blame the Hitlers and Husseins of the world, and much more difficult to stop shuffling along with the herd, helping to create the herd that is so easily manipulated.

Jews participated in Europe's rape of the world. Jewish financiers helped fund New World expeditions, they owned many of the ships used in the slave trade, and were part of the money economy that craved gold and silver. They were largely forced into those positions, but they could have migrated to the Islamic world and been treated better than Europe did, but for a number of reasons, such as increased economic opportunity, the Jews stayed in Europe, although the Middle East was more their "natural" home.

The Modern Age and Jews

There are various lines of demarcation used to separate one period of history from another, all being artificial to a degree. The waning of Church power was critical to Europe's evolution. The Thirty Years' War was a war of the Counter Reformation, waged by the Catholic Church to bring Protestants back into the fold.

The Thirty Years' War marked the end of Catholic military attempts to regain its religious hegemony in Europe. The influence of Catholic dogma eroded. Luther initiated a movement that did not go away. Killing up to a million people in France to wipe out [Catharism](#) kept the Catholic Empire together awhile longer. In the late 1300s and early 1400s, there was the spectacle of the Great Schism, as various "popes" vied for the throne. At one point three people declared themselves the one, true Pope. It did not inspire the flock to watch such power struggles among "holy" men.

Luther's revolution would not be stopped, no matter how many millions of people were slaughtered by the Catholic armies. By 1650, Northern Europe had become Protestant and would never reenter the Catholic fold. Dogma was eroding in other ways. In 1543, a devout and powerful Polish Catholic who was strongly opposed to Luther's work, [Nicolaus Copernicus](#), had a book published on his deathbed. Publishing it while he was dying turned out to be a smart move. In 1514, Copernicus was invited by the Lateran Council to help reform the calendar that had become quite inaccurate. That led him to observing the sun and moon, which led him to propose a radical theory: the earth orbited the sun.

It is impossible to say exactly what Copernicus thought, but it appears that he was not worried about the Church's reaction to his work.[\[67\]](#) He should have been. For the next sixty years, few embraced his work. In 1600, Dominican monk Giordano Bruno was burned alive in Rome

for his heresies, one of the most significant being his belief that the universe was infinitely boundless and the earth revolved around the sun. Bruno was not really a scientist as the term is defined today, but more of a mystic (although the world's greatest scientists were all [mystics](#)), but his execution would put the work of a seminal scientist at risk not long afterward.

In 1609-1610, a devout Italian Catholic was making and using a new instrument: the telescope. In January of 1610, Galileo Galilei saw the moons of Jupiter through his homemade telescope, and observed that not everything in the cosmos revolves around the earth. He announced his findings, which soon had him examined by the Inquisition. During the next generation, Galileo had conflicts with Church authorities, and in 1633 was brought to his knees, forced to recant his statements. The earth was the center of the universe because the Church said so. Galileo was not executed, but spent the rest of his life under house arrest. Yet, he resolutely held to his conviction that observation was more important than merely referring to something an ancient scholar wrote about the nature of reality. If Galileo could see with his own eyes that moons orbited Jupiter, then they did, and the Church's decrees could do nothing to change it.

The work and ordeal of Galileo is seen as the beginning of the age of science in Europe. His treatment at the hands of the Church terrified other men of reason, and Rene Descartes, a French contemporary of Galileo's, was decidedly intimidated by Galileo's treatment, backing off from Copernican philosophy when it was pronounced heretical by the Church. Science and observation eventually prevailed, but not without a cost. Joseph Schwartz makes the case in *The Creative Moment* that Galileo, and later Newton, couched their work in mathematics to make it less susceptible to the Church's attacks. Schwartz argued that those strategic decisions sent science awry, making it rely on mathematics too much, making it more occult than it needed to be. I have never run into a scientific theory that could not largely be explained without mathematics. Math is useful, but many textbooks and other presentations of scientific theories that get so deeply into mathematical minutia that the basic theories themselves get lost under the microscope. Math *has* been used to make science less accessible to the masses, and even ends up confounding scientists at times, and that is a tragedy.

Galileo, Descartes and Newton were major figures in liberating thought from religious dogma, although all were devoutly religious. The scientific revolution that was beginning, along with the failed Counter Reformation, along with the scramble for the earth by the European powers, eventually made life better for Jews. Jews were not without their own intellectual intolerance, and the probably greatest Jewish philosopher of all time, Dutch citizen Baruch Spinoza (1632-1677), was excommunicated by the Synagogue for his rationalist philosophy.

After the Polish massacres in 1650, for the next 150 years, Jewish life in Christian Europe was better than it had ever been. Although many Jews fled Poland, it still had Europe's largest Jewish population. During those years, Jews slowly migrated to the New World, to parts of

Western Europe, and they were not being slaughtered.

During the 1700s, and gaining steam after 1750, a movement began in France called the Enlightenment. The Enlightenment was a movement that stressed the power of reason and the common bonds of humanity. It was the maturation of the work of people such as Descartes and Spinoza. Its goal was replacing dogma with reason. It took the Protestant Revolution a step further, and largely abandoned religion. It was a heady time in Europe. As with all movements, its promise was much greater than its realized potential.

The Renaissance was a movement that spread throughout Europe between the 1400s and 1600s. Some the greatest art humanity has yet produced came from that period. Social advances were still limited, although the Renaissance was related to the Reformation. Artists were largely subservient to a system of royal patronage, and their artistic themes were still largely religious. While the Renaissance was flourishing and humanism developed in European thought, Machiavelli and others were writing their treatises, and witches, books and heretics burned across Europe, and the New World was being [quickly shorn of its native population](#). Nevertheless, one can see glimmers in Renaissance thought that blossomed during the Enlightenment.

In some ways, musical art reached its apex during the Enlightenment, with figures such as Mozart, Beethoven and Hadyn producing masterpieces that may not be possible today. Although the artists were still largely subservient to the royal patronage system, sardonic paintings such as Goya's were being created. Art was becoming more political. Revolutionary political writing became the backbone of the American and French revolutions.

In theory, the Enlightenment would make the lives of Jews better. Its promise was greater than the reality. Prussian Emperor Frederick the Great was supposedly a man of the Enlightenment, and he passed a law regarding Jews in 1750. The law was a mixed blessing, which distinguished between "ordinary" and "extraordinary" Jews, and enacted some oppressive economic measures, but the Enlightenment *did* improve the lives of European Jews. In 1773, the King of Sweden allowed Jews to migrate there, and in 1782, the Austrian Emperor issued an edict of tolerance for the Jews. However, where the Enlightenment really helped Jews was across the ocean, in the British colonies of North America. There were about a thousand Jews in the colonies, a number that would grow greatly. The Enlightenment began in France, and was probably partly inspired by the Native Americans' egalitarian societies, which many Frenchmen had profound respect for. One endemic problem of settling the Americas was the settlers running off and "[going native](#)." European settlers often saw the native way of life as superior to European ways, and ran off to join the Indian tribes. The converse, Indians running to join the white man's "civilization," [almost never occurred](#).^[68]

Enlightenment ideals became influential, and men such as [Thomas Jefferson](#) were children of the Enlightenment. Again, that is relative. Jefferson was a slave owner. [George Washington](#)

was a slave-owning aristocrat who married into more money, and made it big in land speculation, stealing native land. There is significant evidence that the United States modeled its constitution after the [Iroquois Confederacy](#), which had the world's only functioning democracy at that time, something that profoundly influenced [Ben Franklin](#).

The Enlightenment was influential, and one tenet was religious toleration, something nearly impossible to find during Europe's previous 1500 years. Much Enlightenment theorizing on religion was a breath of fresh air that could not have been published earlier. Unfortunately, in rejecting religion, they also ultimately rejected [spirituality](#), although many were "deists." In ways, the Enlightenment helped pave the way for the crass materialism that is seen today in [organized science](#), [economic theory](#) and other areas of Western thought.

Nevertheless, America's [Founding Fathers](#) embraced religious tolerance, although they were in many ways as racist, bigoted, violent, greedy and elitist as could be expected of European descendents. The "Great Experiment" of the United States proved quite beneficial for European Jews. Jews were sometimes prominent supporters of the American Revolution. When the Constitution was finally ratified, it specifically stated that there would be no state religion. Fundamentalist Christian beliefs aside, America has never officially been a Christian nation. In the West, a secular nation was a big improvement over Europe's past 1500 years. Still, nearly all Americans were Christians, and while they could not quite shake their heritage of religious bigotry, Jews were treated better in America than in any European country. In the West, America became the Jews' best friend.

While the U.S. Constitution was being ratified, another revolution influenced by the Enlightenment happened on European soil. The Enlightenment began in France, and the French Revolution was supposed to be a movement of the common man, seeking equality for all. The Jews had great hopes for the [French Revolution](#). In 1784, King Louis XVI abolished the head tax on the Jews of Alsace, and the Bastille was stormed in 1789. In 1791, Jews were officially emancipated in France. It was not a complete emancipation. The decree was only issued after intense political battles, and part of the decree put the government in charge of collecting debts owed to Jews in eastern France. That addendum was not inserted for the Jews' benefit. Nevertheless, Jews were officially free in Europe for the first time. Ghettos were torn down wherever the French had influence.

Along with the step taken forward, events were set in motion that would later haunt the Jews. Voltaire was the leading Enlightenment philosopher, and his later works attacked religion and attacked the Jews for their "superstitions," and accused them of only being good at usury. The Jewish faith was largely what held the Jewish people together. Not all Jews were happy with the anti-religious nature of the Enlightenment and the French Revolution, and one Enlightenment outcome, influenced by Voltaire's anti-Jewish writings, was the development of a secular form of anti-Semitism.

In 1797, the Netherlands and Venetian Republic also emancipated their Jews, under pressure from France. Life began looking good for European Jews. The French Revolution became a bloodbath, with the guillotine being invented and getting avid use. Then a new kind of dictator grabbed power, crowned himself emperor, and [Napoleon](#) initiated a series of wars that led to more European bloodbaths. The French Revolutionary and Napoleonic wars killed about five million people, more than forty percent of them civilians. Although Napoleon is a French national hero, many mystics consider Napoleon the world's first anti-Christ, Hitler the second, and the third may be about to make his appearance.

There are many conspiracy theories surrounding those days, with the founding of the Illuminati, the machinations of the Jewish Rothschild family of financiers, the Freemasons and the Founding Fathers, etc. While there *are* many secret societies, and to a degree they *do* pull the world's strings, and maybe a lot of them, they do not really have that much real power. They can pull the strings because the Great Herd is so easily manipulated. If the herd woke up, the [games of manipulation](#) would end.

While Jews were freed in parts of Western Europe, events in Poland were less auspicious. Russian imperialism was bumping up against Western Europe. Between 1772 and 1795, Russia annexed and partitioned Poland, acquiring the world's largest Jewish community. While Western Europe was being fitfully "enlightened" regarding Jews, Russia was behind the times. The czars had little love for their new Jewish subjects, and laws such as taking Jewish boys from their families at age twelve and turning them into soldiers were little short of genocidal policies.

In Germany, the Enlightenment brought with it another trend that led to the Holocaust. Much of today's Germany was once part of the Holy Roman Empire; the empire that tried reviving the Roman Empire's glory days, wedded to its state religion of Christianity. The Holy Roman Empire began in 800 AD, when Pope Leo III crowned Charlemagne the first Holy Roman Emperor. Its ideal of a union of church and state did not last that long, but the empire still existed when Napoleon's armies invaded in 1806. Napoleon was socially progressive, in a sense, by enacting social reforms such as guaranteed rights, freedom of religion, centralizing the school systems, etc. They were not voluntary for the subject states that he conquered, while installing his relatives on several thrones. Germany was not as swept up into the Enlightenment as England and France were, and when Napoleon rammed the Enlightenment down their throats, the Germans were not happy with it. With the occupation of the Germanic region, Jews there were given rights they never had before. While from the Jewish perspective it was a positive development, the humiliating reign of Napoleon created a yearning in German people for the good old days of imperial glory. They longed for the good old days, and part of the good old days was Jews knowing their place.

Thus began a trend in anti-Semitism that waxed and waned during the next century, culminating in the rise of Hitler. Jews became German scapegoats. Part of the relative

prosperity of their French and English rivals was due to the fact that Germany came late to the global empire game. The Prussian Empire was a northerly empire in the German regions, and they became Europe's most formidable army. Yet, they did not have vast imperial hinterlands to plunder as England and France did. The industrialized world is "rich" not because they are so smart, but because they enslaved the rest of the world to attain their position today. That latecomer factor with Germany had a lot to do with the world wars. The same went for Japan, imperial wannabes who came to the game late, but England, France, Russia and the United States already controlled most of the globe. Even the [Spanish, Dutch and Portuguese](#) empires still had some life in them. Japan and Germany did not have much they could call their own, from an imperial perspective, and they nurtured their ambition over generations.

In the meantime, the [Industrial Revolution](#), partly a product of the Enlightenment, was taking off. What is today call capitalism was first named by Scottish Enlightenment philosopher Adam Smith in *The Wealth of Nations*, published in 1776. In 1769, Scottish inventor [James Watt](#) patented the modern steam engine, which powered the Industrial Revolution. Capitalism and Industry created a new phenomenon in Europe. Great wealth was theoretically being created in the factories that sprouted up across Europe. It was not royalty getting rich, but a new class of people called capitalists. It was a new form of exploitation. How beneficial capitalism has been for humanity is doubtful, and the issue not yet resolved. One positive thing that capitalism and industry did was help to make the institution of chattel slavery obsolete. People did not need the muscle and sinew of black men when a machine could do the job. The rich did not need to own people any more; they could rent them. The defenders of slavery made the not-easily-rebutted argument that somebody takes better care of something they own, than something they rent.

Ironically, the American Revolution inspired the French Revolution, which in turn inspired the [Haitian Revolution in 1791](#). The Haitian Revolution was history's only successful slave rebellion, where a land of slaves freed themselves. Although America was the "land of the free," it had nearly a million African slaves when the revolution began, and what happened in Haiti was ominous for the [Founding Fathers](#), many of them slave owners, such as Jefferson, Washington and Patrick Henry. Those Virginia planters built their fortunes on the triple-evil of raising tobacco with slave labor on stolen native land. Their worst nightmare would be for their slaves to stand up in the tobacco fields, shaking their fists, shouting, "Give me liberty, or give me death!" The United States was about the last nation to officially recognize the Haitian Revolution, and did so largely due to the [Civil War](#)'s political exigencies.

By 1840, there were still only 15,000 Jews in America. They did not have full citizen rights. They could not vote at first, and in Connecticut, for instance, full citizenship was granted only to Christians. After three decades of bitter political fighting, the "Jew Bill" was finally passed in Maryland in 1826, giving Jews the right to vote, hold office and practice law, but Jews still had restrictions on their rights. Although the First Amendment of the Constitution forbade the recognition of religion, the states all passed pro-Christian, and necessarily anti-Jewish, laws.

The European heritage of America could not be completely shaken, and anti-Semitism was an integral part of the American experience.

Jews in America were not slaughtered as they were in Europe. They did not have to wear Jew clothes. The main reasons Jews got that treatment was because of American society's dynamics. There were few Jews in America at the beginning, and Americans were obsessed with [slaughtering and dispossessing Native Americans](#) for most of the nineteenth century. There was also another group more feared than Jews: African slaves. In Europe, they did not have to contend with a large population of slaves of another race, nor a race they were exterminating to give them "living space."

If the United States were not so intent on clearing the continent of its natives and keeping its slaves in chains, the Jewish American experience may have been a starkly different one. In the 1840s, the Industrial Revolution was [rolling along in Britain](#), complementing its colonial hegemony. America was also industrializing, but was slower, partly because it was [busy securing the North American continent](#).

By 1830, the movement that began with the humanists, and was furthered by the Enlightenment, flowered in the liberal movements in Europe between 1830 and 1880. Industrialization may have had something to do with the slaves being freed, but factory workers were not much better off. While the capitalists were getting rich, workers were severely exploited. It led to unionization movements and other attempts to improve the workers' lot. Those years were the era of Charles Dickens' writings. Along with the worker movement were political movements. In the 1830s and 1840s there were revolutionary activities throughout Europe, and along with the increasing freedoms won by workers and other commoners, Jews were emancipated across Europe. In 1847, one of Jewry's greatest theorists envisioned a classless system, and proposed a revolution to permanently end the exploitative rule of the European oligarchy. Karl Marx's *Communist Manifesto* was a call to arms for Europe's oppressed.

Jewish emancipation activities began with Belgium in 1830, and continued with Denmark in 1848, Prussia in 1850, Norway in 1851, Sweden in 1865, Italy in 1870, Switzerland in 1874, and Bulgaria in 1878, along with many other European nations. Not all European nations became enlightened regarding Jews, however. Spain continued four hundred years of anti-Semitic policies, and in 1914, Jews still had no rights in Spain. That also went for Russia and Romania.

In America, Jewish migration began flooding in. Between 1830 and 1865, the Jewish population in America rose from 4500 to 150,000. Other European immigrants came, as American immigration took off. Between 1830 and 1870 the American population tripled, from 13 to 39 million. Between 1870 and 1900 it nearly doubled, from 39 to 76 million. Europe's oppressed masses were flooding into America. The United States population nearly doubled

again from 1900 to 1950, from 76 to 150 million. It has nearly doubled again since 1950, to more than 270 million today. In about 1850, the slave issue in America became heated, and American xenophobia became an issue. Native Americans were [virtually extinct east of the Mississippi River](#) by 1840, and Americans focused their neuroses onto the newcomers. Jews were not the only oppressed group. Irish and German immigrants also felt the heat.

In Poland and Russia, Jews were oppressed. Under Alexander II the Jewish situation improved somewhat, but when he was assassinated in 1881, the Jewish Russian situation became grim. Jew slaughters, called pogroms, became commonplace throughout the Russian Empire. Jews were expelled from Moscow in 1882. There were more than five million Jews in the Russian Empire in 1880. They fled with the initiation of the pogroms. In 1881, Eastern European Jews were only 0.9% of annual immigration into America. By 1887, it had risen to 6.5%.[\[69\]](#) 1.7 million Jews immigrated to America between 1890 and 1914. If there is anything that I can view in American history with some pride, it is that it was a haven for Europe's oppressed people, although at awesome cost to Native Americans and their lands.

Jews were not exactly welcomed to America. Beginning during the 1840s and 1850s, as American xenophobia increased, anti-Semitism began rearing its head, and intensified during the Civil War, with both the North and South blaming Jews for the Civil War's vagaries. [General Ulysses S. Grant](#) expelled Jews from his military district in Tennessee in 1862, blaming them for the mayhem surrounding the war, something Lincoln apparently did not really mind Grant doing, but he rescinded the order for political reasons.[\[70\]](#)

Publicly vented anti-Semitism during the Civil War became heated and extreme, but subsided after the war. Nevertheless, America was well on its way to becoming a thoroughly anti-Semitic culture. By 1900, the United States was quite anti-Semitic, but far from alone. The gains Jews had been making in Western Europe began eroding. In France, the first Western European nation that emancipated its Jews, was the birthplace of a new anti-Semitic fervor that helped lead to the Holocaust.

In 1853, the French diplomat Comte Joseph de Gobineau published a book that distinguished between Aryan virtue and Jewish degeneracy. In 1847 and 1863, Frenchman Ernst Renan published books that argued for the inferiority of Jews. In 1886, Edouard Drumont published *La France juive*, an infamous anti-Semitic tract. Those writings were hugely popular and influenced millions of Europeans, and anti-Semitism was on the rise throughout Europe again. Then there was World War I, the Russian Revolution, the fiscal collapse of Germany after the war, the Great Depression and the rise of Hitler and Fascism. Those days are well known, so I will not belabor them here. What I wish to make clear is that anti-Semitism was not an aberration in Germany. Anti-Semitism was universal throughout the Christian world in those days, and it was most muted in the United States.

It is probably an integral part of the human condition at this time, but when people are under

stress they often lash out at others, and during times of war and other calamities, Jews were nearly always singled out for persecution in the Christian world. From the first Crusade to the Great Depression, Jews had a difficult time when their host nation underwent strain. That was partly due to the "cohesion" of the Jews, keeping themselves separate and distinct from the majority population.

In America, the Civil War brought on a virulent strain of anti-Semitism. It gradually escalated with the millions of Jewish immigrants that fled Europe, and after World War I it erupted into outright hatred of Jews in many places. In the early 1900s, a document emerged that was almost certainly a forgery by the Russians during the pogrom days. It was titled the *Protocols of the Elders of Zion*. That document has given life to various conspiracy theories of Jews taking over the world. It is nearly incoherent in places. Anti-Semitism is alive and well today, with many right wing groups still believing that the *Protocols* are genuine, and that Anne Frank's diary is a fake.

The [Israeli government](#) is ruthless. They are grabbing for as much power as they can, as all governments do. [Menachem Begin](#) was little more than a gangster. Every government exploits its people. Israeli government officials do not read the *Protocols* nightly before bedtime, but they probably study Machiavelli. [Self-serving](#), power-hungry people run every government. That is the nature of the beast today. When anybody looks at an ethnic or racial group, thinking that they are the problem, they are not seeing the full picture, and are easily manipulated against their own interests. Fortunately, in Israel recently they are beginning to teach their children the nation's history more truthfully, with textbooks giving more factual accounts of the Six Days War, where Israel was anything but the underdog, and their textbooks for the first time mention the word "Palestinian." That progress has been undone by the Israeli war against the Palestinians since 2000.

The American right-wingers who see Israel as a problem, standing in the way of world peace, are right. Yet, so is the United States, and far more so. The Jews are not taking over the world, the capitalists already have. They are not one and the same. A lust for power and [greed](#) are not limited to any one ethnic or religious group, although Europeans and their descendants have refined it to a science. There is one aspect of the Jewish journey worth mentioning: peculiarly Jewish pathologies are partly due to the persecution they endured for so long. Being forced to hide their identities, and fleeing back and forth across Europe, while the only "valuable" things they could take during their flight were gold and jewelry, probably created neuroses and fears common to the Jewish people. All oppressed people have their characteristic pathologies, largely due to their journeys.

[Gary Wean](#) stumbled into a dark cabal of gangsters that runs Ventura County. Their influence appears to be vast. Gary found that many of them were Jewish. He apparently stumbled onto Jewish organized crime activities, which robbed the taxpayers of billions of dollars. The biggest gangsters *run the government*. There are probably Jewish gangsters with plenty of

influence in California government and elsewhere, as in the federal government. Again, those are [self-serving](#) Jews. They seem to have a racial/ethnic allegiance, just as organized crime figures do everywhere. The Mafia has its Italian brotherhood. The Chinese have their triads. Japan has its Yakuza. There is the Mexican Mafia. There is the Irish mob. People such as [George Bush](#) help run the Northern European Mafia, perhaps the world's most powerful organized crime group. At the game's highest levels, the lust for power is colorblind, and there might even be a woman or two playing there.

In significant ways, the Jews of Israel are treating the Palestinians worse than Hitler treated the Jews in the 1930s. It is extremely saddening to watch people who should have learned a big lesson from their own history, doing the same thing to others. Children who are beaten by their parents often grow up to beat their children. People cannot seem to keep themselves from inflicting onto others what happened to them. When the Jews said, "never again," after the death camps were opened, they meant "never again" to Jews, not "never again" to anybody. If they could do it to others, they would, and with the Palestinians, they have. Noam Chomsky has written extensively about that phenomenon, a Zionist Jew himself who lived in a kibbutz.

In Europe, anti-Semitism was probably most muted in Britain. Britain made the first legal move to give the Jews a "homeland," with the Balfour Declaration in 1917. For Arabs who had been living in Palestine for thousands of years, dumping a Jewish state on top of them was not salutary. In 1917, of the 600,000 people living in Palestine, perhaps 100,000 were Jewish, and they had largely come there during the previous generation, initiated by the Russian pogroms, and the settlements were almost completely funded by the legendary Rothschild family (and naturally the subject of many conspiracy theories). Although Arab people had been more tolerant of Jews than any other people, most did not like the idea of their land becoming a Jewish state.

European Jews probably would not have much wanted to relocate to Palestine if they had not been subject to a millennium of persecution in Europe. I am half-Scandinavian, and I have no yearning to move back to Norway, although the Vikings did not have the "Promised Land" myths that Jews had. The Jewish "homeland" efforts by the Europeans were in some way related to the African "homeland" effort by America after the slaves were freed, creating new countries in Africa, [such as Liberia](#), so they could ship all the "niggers" back to Africa. There was certainly some altruism with those homeland plans, but there was also a motivation to export undesirable people.

European imperial ambition had been nibbling at the margins of the [Ottoman Empire](#) for centuries, and by 1900, British and French imperialism had conquered the Middle East. It was the logical conclusion of Britain's quest for global hegemony. A quarter of the globe was under British rule in 1914. As with other empires at the height of its power, the decline would soon come, and Britain would be unseated from its imperial perch by its offspring and rival, the

United States. The 1990s may be eventually seen as the beginning of the end of the [American Empire](#). Our economic hegemony has been deteriorating for a generation, as Britain's had for a generation before their empire disintegrated.

Most Middle East friction today is obviously related to it sitting on the world's biggest oil reserves. The current tragedy of [Iraq](#) is only the latest in a century of the white man's greedy meddling in Arab affairs, visiting disaster onto them.

While Britain was carving out a homeland for Jews in Palestine during World War I, wresting it from the Turks, anti-Semitism in Europe would soon reach all-time highs. When World War I began, many Jews saw Russia as their mortal enemy and Germany as their savior. When the German army freed Poland from Russia, Polish Jews thought they had been delivered from the enemy, and at that time, they were. Jews in Britain were reluctant to enlist to fight Germany, when it was freeing the Jews of Poland and Russia. After World War I was over, anti-Semitism subsided in some places, while it took off elsewhere. There were pogroms in Poland and the Ukraine immediately after the war, but Jews shared the general prosperity of the 1920s, and they did not significantly migrate to Palestine until the Great Depression hit and anti-Semitism began its final, tragic climb.

Arabs resisted Jewish/British efforts in Palestine, the British did not help it by diplomatic bungling, and Britain originally restricted Jewish immigration to Palestine, then opened it back up in the 1920s, but few Jews migrated there. A vocal Jewish faction was fervently anti-Zionist, and anti-Zionist fervor from the Jews themselves hampered the deal with Britain. Jews led the Bolshevik Revolution in Russia, and throughout the West people began equating Jews with Communists. To a degree that perception was true, as the classless, collective spirit of Marx was related to the kibbutz tradition of the Jews in Palestine, first begun in 1906 (Marx was partly inspired by Native American societies), but what happened in Russia was starkly different from what Marx had envisioned. It became another power grab, and a bloodbath for Jews.

An effect of the Enlightenment and the social movements of the 1800s was a new kind of Jew. Marx was one of them, as was Leon Trotsky and Rosa Luxemburg. They were non-Jewish Jews, and were a significant fraction of Jews. They saw themselves as human beings whose Jewishness was a byproduct of the social structure in their host nations. They were the Jews behind the Communist movements, and they felt that when the political-social changes happened that overthrew capitalism and the social conditions it helped create, they would all become just people. No class, no ethnicity, just people. In short, they denied their Jewishness, as it is commonly understood. They saw themselves as completely secularized, de-ethnicized, and highly politicized. It is a fascinating ideal, but it has not yet been attained on earth. What happened in the Soviet Union was a grotesque caricature of attempting that ideal, mainly because it was not voluntary. They were going to force uniformity onto humanity. Banning religion altogether was part of the program. It was forced secularization.

They took the Enlightenment to the worst possible extreme. The Bolshevik Revolution became very bloody. It became another power grab, not a realization of humanity's unity. Yet, Jews became identified with that revolution, but when it came time to take it out on Jews, "Jewish" Jews were slaughtered, and about 70,000 Jews were murdered in the civil war that raged in the Ukraine in the 1920s. Across Eastern Europe, Jewish communities were attacked because they were associated, however inaccurately, with Communism, leading to many deaths.

Meanwhile in America, the Communist Revolution scared our capitalist society. Henry Ford owned *The Dearborn Independent*, and in 1920 the paper began running a series of articles attacking Jews, an attack that ran for almost two years solid, and prominently featured *The Protocols of Zion*. Henry Ford was one of the most committed anti-Semites that America ever had. Another noted anti-Semite was Charles Lindbergh, the hero of transatlantic flight.

At the same time Ford mounted an all-out propaganda attack on Jews, Germany was dealing with the disastrous aftermath of World War I. Both World Wars were incidents where the West battled over world control. Germany came late to the Industrial Revolution, and they were not a traditional maritime nation as other Great Powers were. When Germany finally came to the imperial table, there were only crumbs left for them. Britain, France, Russia and the United States controlled most of the globe, and the other European powers had imperial domains that were relatively adequate, although the empires of Spain, Portugal and the Netherlands were but a shadow of their former glory. Germany took what it could, and lost the battle. Instead of coming to a responsible understanding of Germany's motivation, or even looking at the iniquities they themselves inflicted upon the world, the "winners" of World War I foisted on Germany onerous war reparations and took most of its empire, which contributed to a series of events that damaged the German economy.

In the early 1920s a failed artist and soldier, who hated the humiliation Germany had been subjected to at war's end, gained inspiration from Henry Ford's attacks of the Jews, and also lauded Martin Luther's diatribes against the Jews. The man would later tell the *Detroit News* that his inspiration was Henry Ford. That failed artist's name? Adolf Hitler.^[71] The anti-Jewish diatribes of one of America's greatest industrialists and the father of Protestantism directly inspired Hitler.

Anti-Jewish discrimination was widespread in America. Again, although American Jews had it better than in any other Western nation, it was not wonderful. In the 1920s, the industries that practiced discriminatory hiring practices against the Jews were: utilities, banks, insurance companies, publishing houses, engineering and architectural firms, advertising agencies, school districts, major industrial firms, hospitals, universities, and law firms.^[72] Help wanted ads of the day specifically stated that only Christians need apply. The peak year for that type of discrimination was in 1926. An examination of 27,000 job openings found that 90% discriminated against Jews. As in Europe, the careers and jobs Jews held were the ones they

were forced into, when all other avenues of gainful employment were closed to them, and America was where Western Jews *had it the best*.

In 1927, there were more than four million Jews in America, for the world's single-greatest concentration of Jews. After more than a century of Russia's brutal rule, Poland won its independence during World War I as the Russian Empire collapsed during the revolution. When Wall Street collapsed and the Great Depression began in 1929, Poland and the Soviet Union contained about three million Jews each. In 1924, the U.S. began setting immigration quotas by nationality, which greatly reduced the Jewish immigration to America. One consequence was an increase in immigration to Palestine.

The Great Depression was a global event, and Germany's recovering economy was hammered by the Depression. In the depths of the Great Depression, as national desperation vaulted people like Hitler into power, Franklin Roosevelt was desperately trying to flog the U.S. economy back to a semblance of health. 1933 was the darkest year of the Great Depression. During 1933, my father's parents [traveled back and forth across America](#), *Grapes of Wrath* style, trying to find work and food. The Dust Bowl drove them out of Kansas where they had been raised, and they lived in Arkansas, Colorado, Wyoming and Idaho before hearing about jobs in the shipyards in Bellingham, Washington. When my father was born in 1936, his mother was so malnourished that my father was born with rickets, weighed four pounds and nearly died. He was the smallest child in his class until a growth spurt at age fifteen.

Toward the Holocaust

As with the [JFK assassination](#) and other controversies, if somebody wants to have their sanity challenged, they can spend time assimilating the various points of view regarding the years 1933 to 1945, especially pertaining to European Jews and World War II. In many far right circles, Hitler was a tragic hero who lost. The [Jewish Holocaust never happened or was overblown](#), according to some "scholarship." There are those who criticize the Holocaust deniers, and those who criticize them. Another perspective is that the [German people were largely responsible for the Holocaust](#). Another perspective is that [Hitler was nearly solely responsible for it](#). Another perspective is that America and the West had a hand in letting it happen or stood by and watched, which includes David Wyman and many others, including most mainstream historians. Another perspective sees German industrialists having a big hand in it, clamoring for concentration camp labor, then America [hired some of the worst Nazis](#) after the war was over (Christopher Simpson). There are standard texts on the Jewish Holocaust (Raul Hilberg, Lucy Dawidowicz, Leni Yahil). There are large, comprehensive tales of the war. There are books about how crazy it all was (Paul Fussell, Howard Zinn, Noam Chomsky), or how the Jewish Holocaust was similar to the [Native American Holocaust](#) (David

Stannard, Ward Churchill.). There are books about Japanese atrocities (Iris Chang), or about how badly Germans suffered in the [war's aftermath](#). There are books about building the bomb and [nuking Japan](#) (Peter Wyden, Richard Rhodes, Gar Alperovitz). There are many documentaries on Jewish Holocaust survivors, perpetrators, witnesses, etc. Lifetimes can be spent digesting the various viewpoints of those times and events.

Hitler came to power in 1933, and Jews began fleeing Germany. America was not frightened by what happened in Germany, just as Europe did not get too excited when [Spain's Inquisition oppressed mere Jews](#) and Spain [killed off millions of New World natives](#) in its [lust for gold](#), what Germany was doing to its Jewish citizens soon after Hitler came to power did not excite much comment in America or anywhere else in the West. Anti-Semitism was not only rising to unparalleled levels in Germany, but throughout the West. In America, as it again dealt with a national calamity, Jews became the scapegoats. Anti-Semitism reached all-time levels in the United States during the 1930s, only to be surpassed during World War II, to peak *after* the Jewish Holocaust was over.

When Hitler came to power, the greatest physicist of all time was in America, weighing his options in an increasingly anti-Semitic world. In 1933, Albert Einstein was visiting Cal Tech in California. In 1919, there was a supposed confirmation of Einstein's General Theory of Relativity, whereby starlight was bent more than Newton's theories predicted when it passed by the sun during a total eclipse. Einstein became a huge international celebrity in the wake of the announcement of those findings, which are now known to be premature, as they did not prove what they purported to. Nevertheless, "relativity" was the word on everybody's tongue immediately after World War I, but in Germany, where the Jewish Einstein had been persuaded to live as his scientific career blossomed, anti-relativity companies sprouted up, led by Nobel Prize-winning physicist Phillip Lenard and others. Relativity was being called a Jewish plot to corrupt physics.

In 1933, while Einstein was heading back to Germany to begin planning his move to America, Nazi storm troopers ransacked Einstein's Berlin apartment and eventually seized his home, declaring Einstein to be an enemy of the state. Einstein never returned to Germany. Although Einstein was the world's most celebrated scientist, American groups were trying to prevent Einstein's migration, most particularly the Women's Patriot Corporation, that labeled Einstein "a Communist and menace to American institutions," and part of a conspiracy to take over the world. There was a rumored Nazi-sponsored \$5000 price on Einstein's head, and he hid out in England for a few weeks before coming to America to stay.[\[73\]](#)

Einstein was fortunate, being able to migrate because of his celebrity. Other prominent Jews also found ready haven in the West. Most German Jews were not so fortunate. Similar to the argument that [everybody in the world has some hand in what is happening in Iraq today](#), nobody in the West could claim they had nothing to do with the Jewish Holocaust of World War II. Most Jews would have left Germany in a heartbeat, but there was no friendly haven to flee

to. Nobody in the West wanted Jews coming into their countries. Anti-Semitism was at its all-time high in Europe on the eve of World War II. The [capitalistic system](#) had collapsed due to its systemic greed, and nobody wanted to take in Jews. In America, the Western Jewish haven, it was hard times. During the 1930s, America severely tightened its immigration laws, and Jews in particular were denied admittance.

In 1932, six months before Hitler came to power, one British publication stated,

"A crusade of anti-Semitism has been raging from the Rhine to the Vistula, from the Baltic to the Aegean Sea, during the past six months, with a vindictiveness that almost surpasses all previous manifestations of anti-Jewish hatred since the end of the war."[\[74\]](#)

That was *before* Hitler came to power, and it only escalated after that. In those years, Jews were nearly down there with blacks in America. Franklin Roosevelt became president in 1933. He was a politician from New York, and brought Jews into his New Deal agencies (furthering the "Commie" perception of Jews). That led to murmurs throughout America that Jews were running the country. The 1934 resolution submitted to Capitol Hill to express "surprise and pain" at the Jewish treatment in Germany died in committee.

The Jews were fleeing to where they would be taken in. They began pouring into Palestine, and Arabs were not happy with it. In Palestine, Arab leadership was militant and uncooperative. In 1936, there was an Arab uprising in Palestine, and the British drastically curtailed Jewish immigration there. Zionist plans were deeply divided by Jewish factionalism.

In America, Father Charles Coughlin personified the ancient animosity of Catholics toward Jews. He had a weekly national radio show heard by millions of Americans. He was the Rush Limbaugh of the 1930s.[\[75\]](#) His diatribes against Jews were breathtaking. Across America, anti-Semitism was raging. Even a place as genteel as Minnesota began having anti-Jewish campaigns. There were even Nazi rallies in America in 1939. On November 9-10, 1938, Germany had its infamous *Kristallnacht*, which made the world collectively wake up a little. That event even made Roosevelt speak of his shock, but like the politician he was, nothing was done about it in America. A little more than a week after *Kristallnacht*, Coughlin gave his most amazing speech, minimizing the barbarity of *Kristallnacht* and going into a long attack on the Jews, producing forged Nazi documents to support his bizarre contentions.

Coughlin's diatribes helped stir up immense anti-Jewish hatred in America. Coughlin inspired an organization called the Christian Front, which in 1938 had chapters in America's eastern cities, where 85% of America's Jews lived. At Christian Front rallies, there were calls to

"liquidate the Jews of America."[\[76\]](#) That was four years before anybody in America heard of Hitler's Final Solution. At one Christian Front rally, the speaker invoked [General Sheridan's observation regarding the natives](#), and said that the only good Jews were in the cemetery. When a Jew passing by retorted that he was a good Jew and still alive, he was immediately arrested for disturbing the peace.[\[77\]](#)

In Europe, German Jews were desperate, many fleeing anywhere they could. Others thought they could ride it out in Germany, and other nations were not exactly welcoming them. Jews had been mistreated in Europe for a thousand years, and it eventually got better. Those relative few chose what they thought was the frying pan, but it turned out to be the fire. A year before the outbreak of World War II, Europe closed its doors to fleeing Jews. In late 1938, France and Holland closed their doors, not admitting any more Jews. Sweden and Denmark tightened already severe restrictions on Jewish immigrants, even forcibly returning Jews to Germany who did not have the proper papers.[\[78\]](#) In the United States, the mood was often one of sheer hatred.

In 1938, a public opinion poll found 77% of respondents against the idea of letting more German-Jew refugees into America. In 1939, there was a bill introduced in Washington to allow 20,000 refugee Jewish children into America. The bill met with strong and vociferous opposition across America. Roosevelt refused to endorse the wildly unpopular bill, and it died a quiet death. The next year when war broke out, America opened its arms to English children fleeing Britain.

In May 1939, the world observed the spectacle of the [Saint Louis](#)' voyage. A boatload of more than 900 desperate Jews set sail from Hamburg, told that they could gain entrance to Cuba, although Cuba had already invalidated their permits. When arriving in Cuba, they were denied admittance, and then began a desperate series of negotiations for a haven someplace in the world. Many of them had quota numbers for the United States. The United States refused them entry, as did every other country. The boat ended up sailing for days along the Florida coast on its way back to Europe, its passengers looking longingly toward America, but the door was closed. With great effort and a payment of \$500,000 by the Jewish Defense League, Belgium, Holland, Britain and France were persuaded to take in the passengers. Most of those not taken in by Britain eventually ended up in concentration camps. That was how the West reacted to the Jewish plight on the eve of World War II.

One argument directed toward my work has been that European nations refused to admit Jews because they knew the Germans would overrun them soon, so they could not protect the Jews, even if they let them in. That argument has no agreement with any historical facts I could find. For one thing, no nation expected to be overrun by the Germans. Germany was militant, but there was the Soviet Union, Britain and France nearby, and nobody expected them to run over Europe as they did. The success of the German Blitzkrieg amazed even the German generals. At the war's beginning, the Soviet Union, which was Germany's ally for the

moment, was shocked at how rapidly Germany's forces marched across Poland, and scrambled to get in on Poland's spoils.[\[79\]](#) No historian has hinted that the people of the occupied countries resisted Jewish immigration because the Germans would overrun their nation and exterminate the Jews anyway. The Final Solution was disbelieved by most who heard about it while it was happening, even Jews. When the rare Jew would escape the death camps and make it back to his community, his neighboring Jews would often think he was crazy, and refuse to believe his wild tale.

The rapid German victories over the Dutch, French and British forces amazed all involved. An axiom of warfare is that the generals are always prepared to fight the *previous* war. The French heavily fortified the Maginot Line (the axis of conflict during the trench warfare of World War I) in 1939, as their strategists prepared for the previous war. The German Blitzkrieg easily defeated the French, and the Maginot Line was meaningless. In May of 1940, [Winston Churchill](#), the new Prime Minister, was awakened by the French Premier, who told him excitedly, "We have been defeated! We are beaten!" Churchill refused to believe that the French army could have been defeated in a week.[\[80\]](#) The modern warfare of the Germans took Western Europe by surprise.

Nobody in the Gentile world expected the Final Solution to be enacted by the Nazis. [Barbara Tuchman](#) said that if the Gentile world knew that the Nazis were about to exterminate the Jews, they would have applauded. I will be gentler, and say that if the rest of Europe knew what was about to happen, they may have done something about it. In light of [what is happening in Iraq](#) today and the West's response to it, that may be too generous an assessment. In a sense, the extent that Germany took anti-Semitism was incomprehensible to the general populace. Again, if people had known what Hitler and the Germans were capable of, they *may* have been more welcoming to Jewish refugees.

All the same, another argument directed at my work is that because nobody really knew what the Nazis were capable of, their inaction does not make them "culpable." Culpability is not the point of this essay. If somebody comes begging to my door and I send them away, and the next week I see them dead alongside the road, I can tell myself I had no idea they would end up dead. Does that mean that I had no contribution to their fate? Lawyerly types make that exact argument. Claiming ignorance of the future (which we can all do) does not lessen my responsibility, and my lesson should be to ask myself what I could have done, so the next time I do not slam the door in the face of another beggar. While [legalistic attitudes](#) prevail, we will continue to chart our path of disaster, and when the next one happens, we can say, as the German people said after the death camps were opened, "We did not know." Germans who could smell the scent of burning flesh from the nearby camp's ovens, and who watched prisoners being beaten in town by their guards, still said, "I did not know."

That nobody let in Jews before World War II is evidence that they did not expect the Final

Solution to be enacted. Whether the nations were in the shadow of Germany, as the Netherlands was, or as distant as the United States. The Jews had been fleeing back and forth across Europe for nearly two thousand years, and desperate attempts by Jews to flee Germany in the 1930s, and nobody else in Europe wanting to take them in, has rich historical precedence.

Sweden was a neutral power during both World Wars. They did not open their arms to fleeing Jews during the 1930s. On the eve of war, they even tightened the restrictions on Jews moving there. A main reason was that labor unions and others did not want aliens in their nation, competing for jobs. When war broke out, Sweden had 24,000 foreign citizens in their country, for 0.4% of its population. Sweden was one of the "generous" European nations that let Jews in, although Aryans were let in to stay three times as often on the eve of war. The Swedes approved an "extraordinary gesture" of letting 500 children refugees in, because a women's group agitated for it. The Swedes knew the status of the Final Solution as it developed, and as it was being carried out, Sweden did nothing.[\[81\]](#)

Switzerland behaved the best of the Continental nations, but that is not saying much. Anti-Semitism was rampant there too, and in 1942 they further tightened their restrictions on refugees, a decision not reversed until July 1944, when the writing was on the wall for Germany. Many thousands of Jews died because of Switzerland's policies.[\[82\]](#) In recent years, they have been haunted by the scandal of knowledge that the Swiss banks laundered the Jewish assets that the Nazis plundered, such as the gold from teeth that were extracted from the Holocaust victims in the death camps.[\[83\]](#) The Swiss prevailed upon the Nazis to put a "J" on Jewish passports so the Swiss could identify them, so they could turn them back. Germany resisted that Swiss policy, because they felt they would not be able to get rid of Jews to places such as Switzerland, but the Swiss prevailed.

For every Jewish refugee that made it into Switzerland (about 22,000 made it into Switzerland), another was turned back, usually to their deaths. The Swiss banks stonewalled attempts by survivors of the Holocaust to withdraw their money from the banks, or recovery attempts by the heirs of Jewish depositors who died in the Holocaust. The banks demanded documentary proof for people who died in Auschwitz, similar to U.S. demands of citizenship for Americans interned in the camps. Some of it was understandable, but hiding behind bureaucratic procedures has been used for millennia, and was no exception regarding the Holocaust. Some Swiss banks' behaviors were truly scandalous. The banks set up a Holocaust survivors' fund recently, as did the Swiss government, as a very belated gesture, but better late than never. American officers also looted Nazi plunder at the end of World War II.[\[84\]](#)

As with nearly all Jewish Holocaust narratives, a hero here and there dots the landscape, with rare acts of human kindness. Paul Grueninger was one of the few Swiss heroes. In 1938, the border captain altered about 3600 Jewish refugee passports to allow them to stay in

Switzerland. For those heroic acts of a true humanitarian, he was fired, prosecuted, fined and spent the rest of his life, until 1971, living in poverty, unable to get a job, and was even the subject of a smear campaign regarding letting in those Jews. He died a broken man. He was not acquitted of the charges against him until 1995, after his family had tried clearing his name for many years, after five attempts.[\[85\]](#) All too often, that is the fate of the true heroes in this world, vilified while they live, with posthumous recognition, if any. As in all nations, not all Swiss citizens agreed with what their government was doing, and Swiss citizens were more critical of Hitler's regime than their government was, and many Swiss citizens voluntarily housed the Jewish refugees who made it into Switzerland.

Along Europe's periphery, some nations were relatively heroic, their anti-Semitism not as entrenched as in Europe's heart. During the war, Denmark, Finland and Bulgaria saved a substantial portion of their Jews. Denmark saved about 100% of their 5000 to 7000 Jews, smuggling them to Sweden, who, when prevailed upon by their neighbor, finally took in the Jews. Finland saved their 2000 Jews. Bulgaria was a more mixed affair, with most of Bulgaria's Jews being spared, but the Bulgarian army also rounded up thousands of Jews, sending them to Treblinka and other death camps. About 10,000 Jews were saved by a few nations' heroic actions, while more than five million Jews went to their deaths. Reducing the Jewish death toll by 0.2% by peripheral nations is something that people can look to in finding *some* hope and consolation from the Holocaust.

Here and there across Europe, and even in Germany, some people risked their lives by hiding Jews. Those people have been lionized, yet they nearly invariably said that their actions were not heroic, but something that anybody would have done. Their modesty is understandable, but they were extremely rare. Noam Chomsky says that what has driven his tireless efforts for human rights for the past thirty-five years is so he can look himself in the mirror. Yes, he does, but the highly developed conscience of a Noam Chomsky is extremely rare. For those who hid Jews or engage in activities as Chomsky does, their answer is the same. They say they are only doing the decent thing, or trying to keep their consciences' clear. They are not superhuman, just rare.

On the Jewish Holocaust's causes, there is a vast spectrum of opinion. One of this site's themes, as the staunch pacifist that I am, is that [violence always begets violence](#). There will be no war to end all wars, except the one that extinguishes the human species. The Jewish Holocaust took place in the world's most violent culture: Europe. The Holocaust took place in the middle of a war that killed about sixty million people (and perhaps even 100 million), the bloodiest war of all time, so far. The Jewish Holocaust was only about ten percent of that total, or less. On one hand, it was merely part of the scenery of murder that raged across the white man's world. Yes, the Jews were singled out (Gypsies and Slavs were too) for a unique fate, a fate that was the culmination of a thousand years of abuse by the Christian world. Yet, what made Germany into such a hotbed of it?

In Paul Johnson's *A History of the Jews*, he discusses the constellation of reasons for the Holocaust.^[86] First, and perhaps most primary and immediate, was World War I. The German people had just experienced a period of unprecedented prosperity and modernization when World War I happened. They were flexing their muscles as a nation, feeling their power and glory. As with Japan, who nurtured their imperial ambition for generations, wanting to be successful imperial overlords as the British, French, Russians and Americans were, Germany had grand designs for coming to the imperial table. The British, French and Americans *had* to be their role models, to an extent. Yet, they had already [gobbled up the globe](#). The British Empire spanned the globe, owning a quarter of it. The French Empire was second to Britain's in size, where their imperial domains included parts of the Middle East, Southeast Asia, Africa and a share of China.

The United States, the first breakaway colony, had come to dominate the entire Western Hemisphere. It had its [Monroe Doctrine](#) and [Roosevelt Corollary](#), which staked out the entire Western Hemisphere (with the exception of Canada) as its imperial domain. It was refining a new form of colonialism that the British were experimenting with, known as [neocolonialism](#), whereby the [American flag](#) did not necessarily fly over its subject nations, but the U.S. was in charge nevertheless. European nations were not allowed a free hand in plundering Latin America; it was the United States' game and nobody else's. Even so, America expanded its empire impressively. Other nations such as the Spanish, Dutch and Portuguese had remnants of their empires dotting the globe. The white man had a claim on virtually every valuable acre of planet earth, and the Germans had little of it to befit their new stature as a great nation.

The Germans had few distant lands to plunder, and to the east of them was another empire: the Russian Empire. The Russian Empire spanned northern Asia and bordered Germany. Those realities led Germany to war against the other imperial powers. After the war, the imperial powers humiliated Germany with onerous war reparations and took most of its imperial hinterland. As Johnson observed, a primary effect of World War I, besides stunting Germany's ambition, was making German society a more violent place. Where violence in civil life was unknown in the years before World War I, one of the consequences of the war was a generation of men who became intimately familiar with the art of murder.

The psychology of warfare and soldiers shows that young men do not naturally desire to murder other people, particularly those they have never met. What turns young men into murderers is a [culture that encourages violence](#), as in its media and ideology. The appeal to patriotism is a primary brainwashing tactic, something [Hermann Goering said was common to all nations](#). In addition, dehumanizing the "enemy" is a vital component of the program. If the young men do not feel like they are killing fellow human beings, they can do it much easier. Even with all that, young men do not readily commit violent acts. In numerous accounts, whether it is the Japanese raping Nanking citizens, the Germans annihilating Jews in Eastern Europe, American soldiers killing Native American women, Japanese soldiers or Vietnamese civilians, or French revolutionaries killing each other, their first kills do not come easily. The

witnesses and participants to the acts describe an inner revulsion at first, but with each kill, their inhibitions gradually cease, and some even glory in it after awhile. They are on the highway to hell, but most people readily develop inner mechanisms that allow them to continue doing it. Many American soldiers have crossed that threshold in [macabre ways](#).

Christopher Browning's *Ordinary Men* examines the phenomenon of German Reserve Police Battalion 101 that became a Jew-killer squad in Poland. The men of Reserve Police Battalion 101 were largely drafted from Hamburg, and were simple barbers, plumbers and the like, largely men more than thirty years old. They were not Nazis, but typical Germans, relatively apolitical. They eventually became adroit Jew-killers, directly killing about 40,000 Jews and deporting another 45,000 to the death camps. The book's most chilling sentence is its last one,

"If the men of Reserve Police Battalion 101 could become killers under such circumstances, what group of men cannot?"[\[87\]](#)

As with a famous psychology experiment at Stanford, where "normal" people played the prisoner and guard game, about a third of the guards quickly became sadistic, about half became "tough but fair," and less than 20% became "good guards," who tried being kind to their charges (or in the case of Reserve Police Battalion 101, somehow shirked their killing duties). The same statistics applied to the men of Reserve Police Battalion 101.[\[88\]](#)

After World War I, violence in German society became increasingly commonplace, and political ideologies readily adopted violent strategies. That was not only in Germany, but also in other war participants, such as Russia and across Eastern Europe. The rise of Hitler was not unusual, although historians still grope for a full understanding of it. Anti-Semitism was an integral part of the day's German mentality, and the aftermath of World War I made violence an increasingly acceptable aspect of the day's ideology. Murdering Jews and other political/ideological targets became commonplace in German society immediately after the war, with the perpetrators rarely brought to trial, and given light sentences even if convicted. Hitler's philosophy helped create an atmosphere where the Jew eventually became seen as subhuman. "Vermin" was a typical appellation given to Jews back then.

When Germans were killing Jews in the early 1920s, in America similar events were happening. Recently, mass graves have been discovered from the Tulsa Race Riot of 1921. In the wake of the oil boom in Oklahoma, many blacks escaped the South and its [lynch-happy](#), Jim Crow environment. They formed one of America's most prosperous black communities. Booker T. Washington characterized the Greenwood section of Tulsa as the "Negro's Wall

Street." Racists referred to Greenwood as "Little Africa."

Blacks were forced into segregated living, as the Jews in their ghettos had been for centuries. The Tulsa police were virulently racist, allying themselves with the Ku Klux Klan. The event that touched off the "race riot" was when a black shoeshine man was falsely accused of accosting a white woman in an elevator. The *Tulsa Tribune* ran an editorial entitled "To Lynch a Negro Tonight" the next day, and a mob of 2000 white people surrounded the jail, ready for a lynching. About 75 black men heroically stood in front of them, to prevent the lynching. As often happens, as the whites assaulted the black men a shot rang out, and then it was "open season on niggers." Armed bands of whites rampaged through the black section of town, burning buildings and shooting any black on sight. The "riot" made history when a plane dropped dynamite onto the black neighborhoods, for history's first bombings by plane. Several days later, hundreds of black people lay dead, and were buried in mass graves. Six thousand blacks were rounded up and imprisoned. The official report stated that less than forty people died in the "riot." Mass graves were recently discovered and exhumed.^[89] The death toll is probably at least 300 people.

Is what happened in post-war Germany so difficult to understand, particularly as the United States is [killing thousands of Iraqi children each month](#) as I am writing this? Between Southeast Asia and Iraq alone, the United States has probably been primarily responsible for the deaths of more people than the number of Jews who died in the Nazi death camps, distant nations that did us no harm, not by any stretch of the imagination. Hitler, no matter how crazy he was, had perhaps more justification for what he did to Jews than the United States had for what it has done to Southeast Asia and Iraq. If the Nazis were the most evil regime of all time, what does that make today's United States? Hitler and his boys *were* practitioners of evil, but they have also been scapegoats. Nazi Germany was not that greatly different than today's United States, especially as the United States has a currently unelected president, from a [family that openly supported Nazi Germany](#).

The United States has the [world's largest prison population](#), which is increasingly filled with political prisoners and people who did not commit what any rational person would consider a crime. During the last fifty years, our nation has been primarily responsible for the deaths of [several million people](#) and the continued misery of hundreds of hundreds of millions, if not billions. The Nazis were minor leaguers; imperial wannabes who could not make the grade, who did not really take it out on the Jews until their military advances were blunted, and they realized that they would not roll over the world. Hitler had no monopoly on telling the [Big Lie](#). In Nazi Germany and the occupied nations, some noble souls stood up to the evil, risking their lives to hide Jews. They were extremely rare, but they existed. Some Americans are trying to end the awesome injustices that the United States inflicts on the planet today. They are also rare, but they exist. German citizens themselves were not at great risk for not playing the game properly, but a person in the Nazi-occupied Ukraine, for instance, would be summarily executed along with their families for hiding Jews. In America, a death squad does not usually

visit dissident writers, although it happens, as with the FBI's COINTELPRO program and what it did to Fred Hampton. In the imperial hinterlands however, [El Salvadoran](#) dissidents to the U. S. Empire were taken out and shot without a second thought by U.S.-trained troops, and their heads mounted on poles alongside roads as an instructive lesson for other dissidents who might dare to raise their voice.[\[90\]](#)

The Holocaust was a phenomenon that derived from a millennium of Western racism and anti-Semitism. It also derived from the incessant warrior mentality of Europe, a culture far more warlike and deadly than any other in history. It also derived from the [greed](#) that drove the [quest for empire](#) that characterized all the European nations, [which has evolved into capitalism](#).

For all the heroic actions of Denmark during World War II, they had a small Jewish population (the nearby Netherlands had a Jewish population of 140,000 in 1939) because they were less than welcoming to Jews over the centuries. Many Jews were in Eastern Europe because they had been booted out of Western Europe centuries earlier. The anti-Semitism in Scandinavia was more muted than that of mainland Europe, but far from noble.

We all have a hand in world events, although the causal relationship can be difficult to see. As a rule, people do not see the relationship between pumping cheap gasoline in America, for instance, and the [deaths of children in Iraq](#), [East Timor](#) and [Nigeria](#). Those pumping the cheap gasoline are beneficiaries of the carnage, however indirect they may think it is. In America, people do not usually see that their fast food hamburgers were produced by the [unspeakable suffering of animals](#) enslaved to an incredibly inhumane system, served by people oppressed by the [capitalistic system](#). Those Americans usually do not see the relationship between their cheap running shoes and the neocolonial system that has virtual slaves making those shoes in ghastly working environments in U.S. client states such as [Indonesia](#). Americans rarely see the relationship between their cheap bananas and the mass murder and capitalistic oppression in [Central America](#) that keeps those cheap bananas coming. Projecting the "evil" onto Saddam Hussein or Hitler (or the large corporations) is convenient, but is one more way to play the victim game.

Another painful aspect of the Jewish Holocaust is that the Third Reich did not originally want to exterminate the Jews. They wanted to get rid of them, but nobody wanted them.

Howard Zinn wrote in his *Declarations of Independence*,

"Not only did waging war against Hitler fail to save the Jews, war itself bought on the Final Solution of the genocide. This is not to remove responsibility from Hitler and the Nazis, but

there is much evidence that Germany's anti-Semitic actions, cruel as they were, would not have turned to mass murder were it not for the psychic distortions of war, acting on already distorted minds. Hitler's early aim was forced emigration, not extermination, but the frenzy of war created an atmosphere in which the policy turned to genocide. This is the view of Princeton historian Arnold Mayer, in his book *Why Did the Heavens not Darken*, and it is supported by the chronology - that not until Germany was at war was the Final Solution adopted.

"Hilberg, in his classic work on the Holocaust says, 'From 1938 to 1940, Hitler made extraordinary and unusual attempts to bring about a vast emigration scheme... the Jews were not killed before the emigration policy was literally exhausted.' The Nazis found that the Western powers were not anxious to cooperate in emigration and that no one wanted the Jews."[\[91\]](#)

The voyage of the *Saint Louis* was part of Germany's forced emigration strategy. They forced Jews onto boats and made them sail down the Danube, or forced them into frontiers where they then snuck into Western nations, but nobody wanted them. Many Jews wanted to get into Palestine, but in the interest of preserving "stability" in the region (placating the Arabs, not dumping Jews on them), Britain drastically limited migration to the region. Consequently, Britain let in some Jews, the only European nation that did to any significant degree. Its policy was more to keep the Jews out of Palestine than it was welcoming the Jews to Britain.

Raul Hilberg is probably the world's greatest Holocaust scholar. He wrote *Perpetrators, Victims, Bystanders*, which provides penetrating insights into the mentalities of the players in the Jewish Holocaust. The word "hero" does not appear in the book's title. The most noble and heroic people of those days were those who simply helped others when they could give it. Those few who hid Jews at the risk of their lives in Europe were probably the most heroic of all, and as a group the only people whose deeds were truly selfless. Hilberg observed that those "altruists and humanitarians" sometimes were embarrassed by the praise heaped on them after the war, and usually replied that they were only doing the decent thing, something that anybody would do.[\[92\]](#) Hilberg demonstrated that nearly everybody had a hand in the Jewish Holocaust to one degree or another. Whether it was lawyers and accountants doing the technical work of digesting the loot from the [Aryanization program](#), doctors actively involved in barring German Jews from the medical profession to eliminate the competition, churches that provided certificates of Aryan descent of its parishioners, or "bystanders" such as the allied nations, or the Pope quietly watching the Nazis seize and ship Jews from Rome, within shouting distance of the Vatican, *everybody* had a hand in it. Some were more actively involved than others, but there were few heroes and saints, and various levels of complicity for virtually everybody else.

World War II began on September 1, 1939, when Germany invaded Poland, and the Jewish fate became clearer. While the Final Solution was finally formulated and carried out, anti-Semitism in America *increased*. In a 1942 opinion poll, when Americans were asked to name the greatest threats to America, Jews came in third, behind the Germans and Japanese.[\[93\]](#) In polls given in the 1940s to the question, "Have you heard any criticism or talk against the Jews in the last six months?" It steadily climbed from 46% in 1940, to an all-time high of 64% in 1946.[\[94\]](#) In 1942, a poll asked American high school students which groups, of seven listed, would be their last choice as a roommate. Only two groups received more than a ten-percent response rate. Blacks were 78%, and Jews 45%. In the same month, factory workers were asked which groups they least wanted to move to their neighborhood. It was the same list the high school students saw, and was 72% blacks, 42% Jews and 28% Chinese.[\[95\]](#)

The first official news in America that the Nazis were exterminating European Jews was reported in the *New York Times* on November 25, 1942. The article stated that the State Department confirmed that the Nazis had already systematically murdered two million Jews. That story was reported on page ten. There was no outrage in America. Roosevelt made no comment on the story, and no reporter asked him about it. No politician made an issue of it. It was a non-story. Few really cared if Jews were being slaughtered, especially when there were Nazis and (especially) Japs to fight. A 1942 poll showed that 66% of Americans wanted the battle against the Japanese in the Pacific to take precedence over battling Germany.[\[96\]](#)

While the Final Solution was being carried out, the State Department purposefully tightened restrictions on Jewish immigration to America. Many American Jews did not want more Jews immigrating to America, because each new Jew further inflamed American anti-Semitism, and the United States was the *great savior* of Jews in World War II.

The infamous voyage of the [Saint Louis](#), the national protest regarding letting in 20,000 Jewish children refugees smuggled out of Germany and Austria, the Nazi rallies in America and the pervasive anti-Semitism were all part of 1939 America. Across America were Silver Shirt stores that sold anti-Jewish propaganda. The anti-Semitism was naturally the worst where Jews lived, mainly on America's East Coast. The embrace of the Fascist systems of Germany and Italy by American industrialists, the mainstream media and politicians, was also part of the terrain. Jews were seen as Communists in America, furthering anti-Semitic hatred. Many Americans saw Jews getting jobs in New Deal agencies as ominous. More than half of Americans wanted Jews segregated as blacks were. *Every nation* tightened down the screws on Jewish immigration on the eve of war.

While Jews found employment in New Deal agencies, old-line agencies such as the State Department, War Department, etc., were dominated by Eastern Oligarchy types, and were against hiring Jews. The State Department guided foreign policy, just as it does today. They controlled immigration. Ivy Leaguers staffed the State Department. They were decidedly unsympathetic to the Jewish plight. In early 1940, Breckenridge Long, the American

Ambassador to Italy who thought that Fascism was great, became the assistant Secretary of State. Long soon began directing the State Department to curtail Jewish immigration into America, and in an infamous June 1940 memo, Long informed his people how to bureaucratically thwart potential immigrants. At that time, Jews were desperately trying to flee Europe, particularly via France and Spain. Long's leadership provided the desired result, and the already paltry immigration to America was quickly cut in half. Long initiated other measures, which brought immigration to a standstill by the summer of 1941. That was months before Pearl Harbor, and America was the world's "great neutral power" at that time.

By the summer of 1941, Hitler's euthanasia policy was underway in Germany. It was not covered up very well, and Germans discovered what was happening and protested. The first crematoria incinerated the insane, retarded and otherwise flawed of Germany. As German people began protesting the euthanasia program, the Third Reich began tightening the security of such extermination projects, paving the way for death camp security afterwards.

By the winter of 1941, the German offensive was blunted in Russia, and the Hitler's grandiose designs for a purified world, under glorious German hegemony, began evaporating, and the turn to the Final Solution at Wannsee in January 1942 gave a new direction to the German goal. If Germany could not conquer the world, it would at least cleanse its corner of the world of inferior races.

The Final Solution was well underway by early 1942, and the industrialization of genocide was undertaken for the first time. The death factories of Poland were built and began churning out their unspeakable product. The November 1942 *New York Times* article was a tardy admission of what knowledgeable observers of World War II already knew. Jewish leaders began lobbying the White House in late 1942, to no effect.

In early 1943, American Jews began agitating for U.S. action regarding the slaughter of Europe's Jews. While Jews began pressing for action, the State Department was instructing its Swiss office to stop forwarding reports of the Final Solution. They were actively covering-up the Holocaust, in an early instance of Holocaust denial. Jewish activism got the U.S. government to convene a conference at Bermuda between British and American diplomats, the Jews' best friends in the West. The April 1943 Bermuda conference accomplished nothing, mainly because the attendees were told to not accomplish anything. The conference was calculated to give the *appearance* of concern. By late 1943, the Third Reich's death machine had consumed millions of Jews. There were a handful of national politicians in America who sided with the Jewish plight, the most prominent being Will Rogers Junior, a congressional representative from Oklahoma and the part-[Cherokee](#) son of Will Rogers. Rogers joined the Bergson Group, which was a small but highly active group in America, lobbying for U.S. government action. On October 6, 1943, 4000 rabbis presented a petition to the White House to plead for action on behalf of Europe's Jews. Roosevelt begged off from attending the presentation due to a schedule conflict, and had his vice-president accept the petition.

Roosevelt's calendar for that day shows that he had time to accept the petition, but chose not to.

There were some highly placed Jews in U.S. government. The relatively few Jews saved by America in World War II can partly thank the Jewish Henry Morgenthau Junior, the Secretary of the Treasury, for directing the Treasury Department to investigate why Jews were not getting into America, when the death factories were at full production.

An infamous incident regarding America, Britain and the Jews occurred over an offer the Nazis made to sell 70,000 Romanian Jews for about \$9 million. The State Department blocked the deal. The Treasury Department became involved and approved the deal. During the Treasury Department investigation that Morgenthau initiated, documents surfaced which detailed further State Department complicity in the Jewish Holocaust. Not only did the State Department memo surface that ordered its Swiss office to not forward Holocaust reports, but two other documents were discovered, one created by the State Department, the other by the British Foreign Office.

The State Department and the British Foreign Office were of like mind on the Romanian deal, which they worked in unison to sabotage. The British document stated that they opposed the Romanian Jew purchase due to the "difficulty of disposing of any considerable number of refugees should they be rescued." The State Department document stated the "danger" that the Nazis might "turn over" a large number of Jewish refugees. Those two diplomatic bodies were genuinely afraid that the Nazis might give them those 70,000 Jews instead of gassing them. Morgenthau wrote that those two august bodies' behavior amounted to "diplomatic double-talk, cold and correct and adding up to a sentence of death" for European Jews.[\[97\]](#) While that scandal was hatching, Long testified in a session on Capitol Hill, where he lied about how many immigrants (he greatly exaggerated it), and Jews in particular, had been let into the United States during the critical years.

Morgenthau's Treasury Department issued a report on the scandal, titled "Report to the Secretary on the Acquiescence of This Government in the Murder of the Jews." Morgenthau met with Roosevelt on January 16, 1944, and laid out the facts. Ever the politician, Roosevelt foresaw a stinking mess coming up soon in the Congress and Senate, and other activism that was about to make the Jews' fate a public event. Six days after the meeting, Roosevelt issued executive order 9417, creating the War Refugee Board (WRB). It prevented the looming scandal, yet the wording of his statement carefully excluded the word "Jew," and the agency had virtually no funding and almost no cooperation from any other governmental agency. John Pehle of the Treasury Department was named to head the agency, and with little funding and almost no cooperation from any other agency, the WRB did its best to help Jews escape the death machine in Europe, and may have saved some. The WRB was virtually alone among all U.S. governmental agencies in helping Europe's Jews.

There are other acts by the U.S. government worth reporting. Part of the charade of America caring about Jewish suffering was establishing a refugee camp on American soil. It was established in the countryside in New York. It took in less than 1000 Jews, and its stated intention was to ship them back to Europe when the war was over. It was more of a [public relations](#) stunt than any help to the Jews.

Jewish leaders continually lobbied the White House during the war's last year, and one request repeatedly made was for the Allied forces to bomb the crematoria at Auschwitz. The military gave interesting excuses for why they could not bomb Auschwitz. They said they could not fly a mission from England, as it was too far for fighter support. Ironically, while the ovens at Auschwitz were running night and day, the United States flew numerous bombing missions in the region, based out of Italy. The United States even targeted the Farben facility next to Auschwitz, while giving the excuse that they could not bomb Auschwitz. There is a photograph taken from a bomber that dropped bombs on the Farben facility. In the photograph, the Auschwitz facilities are directly below the plane as the bombs were dropping, aiming at the Farben facilities.[\[98\]](#) Some American bombs even landed on Auschwitz *accidentally*, killing nearly a hundred inmates and guards. The United States helped about 150,000 Jews lose their lives at Auschwitz while they refused to bomb the crematoria.

As the death camps were opened at war's end, it could no longer be denied what the Nazis had done. It stands as one of history's most evil mass murders. The Jewish Holocaust was the culmination of a thousand years of anti-Semitism in Europe, several hundred years of incessant European warfare, European greed and other factors. The entire West had a hand in what happened. Blaming Hitler and the Germans is convenient and makes them scapegoats, but they were merely the most accomplished practitioners of anti-Semitism. They took the game to a new level.

Perhaps the best documentary on the rise and fall of Hitler is the 1961 British production *Mein Kampf*. It can be rented from video stores even today. It is an understated account of those times, using German footage for nearly all of it. The introduction of *Mein Kampf* states,

"This account of Hitler's Hell on earth is dedicated in guilt to his victims. As human beings we are responsible - for he was one of us and we permitted it to happen.

"May we be wise enough and strong enough to prevent this from ever happening again!"

When Hitler's *Mein Kampf* was published in the United States in the 1930s, it was sanitized, with his most vicious anti-Semitic passages edited out. People such as FDR read the unedited

version, but did not publicize it.

At battle's end in Europe, the death camps were opened and the surviving inmates staggered out. Not only did the death camps, Einsatzgruppen and other actions consume more than five million Jews, about a third of the world's Jews, but a million or more Gypsies also died in the conflagration as well as other assorted unfortunates, such as Jehovah's Witnesses. Four million Soviet soldiers [died in the Nazi prison camps](#) in Eastern Europe, their deaths part of the Nazi's overall plan of death and destruction of "inferior" people. After the world was cleansed of Jews and Gypsies, next on Hitler's list was ridding Eastern Europe of the Slavs, clearing the land for settlement by Germans. World War II was an insane orgy of violence that left about sixty million people dead (or as many as 100 million), and as with all wars of the 20th century, at least half of the deaths were civilian.[\[99\]](#) Millions more were displaced, and many millions more lives were shattered. More than thirty million civilians died in World War II. They were the most devastating few years in world history, as white people fought over global control, with Japan joining the fray, killing at least ten and perhaps fifteen million (with estimates as high as twenty million) Chinese citizens during their brief but brutal rule. That was on top of the more than twenty million who died a generation earlier in World War I, half of them civilians, and another fifteen million or so who died in the Soviet Union's purges and general Soviet repression. That is at least 100 million deaths in events that spanned a generation. The devastation that Europe wreaked on the planet finally came home to terrifying effect, in the final consequence of all militarism.

When the death camps were opened, the world was shocked, but not that much. A few months later the United States [dropped atom bombs](#) on Japanese cities, killing hundreds of thousands of civilians. The firebombing of Dresden and Tokyo by the United States and its allies in early 1945 was merely a sign of the times. One Nazi strategy during the Jewish Holocaust was reducing the Jews to what appeared a subhuman state, to further justify their extermination. The people who designed the programs, such as Himmler, were diabolically sane. Forcing the Jews into ghettos where they starved to death in squalor was part of a plan to reduce them to their lowest state. The dignity with which many Jews faced their extermination was inspiring.

Genocide researchers such as David Stannard, Ward Churchill and Robert Jay Lifton have commented regarding the high emotional toll that such research takes. The denied darkness is a big reason why the West is so sick. Turning [Columbus](#), [Washington](#), [Custer](#), [Serra](#), [Bush](#) and the rest of that mass murdering rogues gallery into heroes indicates a people that cannot face their darkness, and are consequently doomed to keep recreating the same disasters over and over.

Those who survived the death camps had deep physical, emotional, and mental trauma. The numerous survivor accounts attest to the immense psychological burden they endured. Not every concentration camp was an outright extermination camp, and children grew up in some

of them. Of all the Jewish Holocaust accounts I have read and watched over the years, one in particular has haunted me. It is not a heart-wrenching tale of horror and survival, but regarding the psychological responses that attended the camp experience. Werner Weinberg was interned at Bergen-Belsen for fifteen months in 1944-1945. Weinberg wrote that life there did not become the hell it became infamous for until the war's last few months, when the supply lines were cut and the Nazis fled the Eastern Front before the Soviet armies. The huge influx of prisoners from the East, coinciding with cutting the supply lines, turned Bergen-Belsen into a living hell. Yet, it still was not an extermination camp, as such. Weinberg wrote that there was a code of ethics of sorts, such as the prisoners frowning on cannibalism.

One day when Weinberg was on a work detail that transported a cart across the camp, acting as the horses that normally drew the cart. Dying inmates lay everywhere in those final days. The Nazis called them *musselmen*. *Musselmen* lost so much weight that they became human skeletons and lost all semblance of sentience, lying in the mud, waiting to die. Dying *musselmen* were obstacles for the cart, and the crew had to stop the cart and move the *musselmen* (alive or dead) out of the way. One of Weinberg's crew had recently been transferred from Auschwitz, and was disgusted with the spectacle of *musselmen* littering the camp, blocking the progress of their cart. The inmate from Auschwitz boasted, "No *musselmen* in Auschwitz! They were the first to go up the chimney!" Weinberg was speechless. He was impressed by the new inmate's observation, and felt shame that Bergen-Belsen could not match the cleanly efficiency of Auschwitz.[\[100\]](#)

Anti-Semitism in America *increased* after the camps were opened, as measured by the poll that showed American anti-Semitism peaking in 1946.[\[101\]](#) Even in September of 1945, after the world knew of the death camps, 22% of American soldiers thought that the Nazi treatment of Jews was justified, and another 10% were not sure.[\[102\]](#) Arno Mayer, an officer in the war, was handed a note that stated, "When we finish with the Germans and the Japs, we'll come back and kill the Jews and the blacks."[\[103\]](#) More Japanese than Germans were executed following the war crimes trials.

In Europe, anti-Semitism did not abate with opening the camps. The wretches that walked out of the camps often elicited disgust more than pity. General Patton stated that the camp survivors in his care were a "subhuman species without any of the cultural or social refinements of our time." He said that no ordinary people "could have sunk to the level of degradation these have reached in the short space of four years."[\[104\]](#) Jews newly freed from the camps begged to not be sent to where they lived before the Jewish Holocaust. As American soldiers herded Jews onto trains bound for Poland, men would fall to their knees, yelling, "Kill me now! You might just as well kill me now, I am dead anyway if I go back to Poland." They were right in many cases. The last half of 1945 saw many anti-Jew riots in Poland, and there were 350 anti-Semitic murders in Poland during those months after the war.[\[105\]](#)

Those post-war attitudes had a major bearing on the establishment of Israel. The Jews had their Promised Land tradition, going back millennia. Before the Holocaust, there was a marked difference of opinion in the Jewish population about having a Jewish state, a concept known as Zionism. After the Holocaust, the need for a Jewish state was obvious to all surviving Jews, and Israel was founded. Unfortunately, their Promised Land became more of a refuge from a world that hated them. If not for the Christian/European hatred of Jews, today's [state of affairs in Israel](#) would probably not exist. The Jews established a state right on top of Arabs that had lived there, in relative harmony with Jews, for thousands of years. The Jews did not enjoy peace and plenty throughout the Islamic world. Jewish/Islamic relations deteriorated over the centuries, and the situation in Northern Africa was quite bad, with massacres from time to time. There were anti-Jewish riots in the 1940s in Islamic nations, which killed about a thousand Jews. Yet, the Palestinians who had lived in Palestine for two thousand years suddenly were expelled by the creation of a Jewish state right on top of them. The establishment of Israel was a crime, no matter if the United Nations was behind it. To Jewish credit, many have debated the establishment of a Jewish state. The issue of state versus human rights has been at the center of Jewish life since Moses.

Today, Israel has a nuclear arsenal with hundreds of nuclear warheads, with about a hundred missiles aimed at Arab cities. Israel's craziness and paranoia can be partly attributed to centuries of persecution, with the Jewish Holocaust topping it off. Many Arabs saw the establishment of the Jewish state as more of an outpost of Western imperialism than a refuge from Western anti-Semitism. Einstein had the right idea when he remarked that a Jewish state should be established in an atmosphere of peace and friendship with the Arabs. That did not happen. Neither party was amenable to negotiation, and the British helped bungle things, partly by inventing the position of Grand Mufti for Jerusalem, then appointing a militant Arab to the post.^[106] The insanity of World War II affected both Jews and Arabs. [Menachem Begin](#) was a bona fide terrorist, with his Irgun terrorist group blowing up a hotel, killing many people. Stern Gang, another Jewish terrorist group, even sought collaboration with the Nazis, offering to fight alongside the Nazis, proposing that the Jews having a racist empire in the Middle East, while Germany had one in Europe.^[107] Yitzhak Shamir, the future Prime Minister of Israel, ran Stern Gang after Avraham Stern was killed, and Shamir never renounced Stern Gang's support of Hitler. The peaceful Jews of Europe had largely been herded into the death camps, their loss incalculable. Their peaceful and accommodating collective voice may have made the situation in Israel today a very different one.

Although opening the death camps was somewhat shocking to American sensibilities, the steep fall in anti-Semitism in America between 1946 and 1950 had more to do with other factors than a twinge of conscience over America's hand in the Jewish Holocaust. Racism and bigotry in America was deeply ingrained. The death camps showed how low humanity could stoop in its hatred. War crimes trials began in late 1945. America assumed a self-righteous posture regarding the Nuremberg trials, calling what the Nazis did an unparalleled crime. The United States was in a curious position. The war crimes trials were definitely a winners' court.

The United States had completed the "[ethnic cleansing](#)" of its land of natives only a few generations earlier. During World War II, black Americans in the military were often treated abominably. Having its face rubbed in racism and bigotry, seeing the extremes that Hitler and his chums could take the game, led to American introspection, and returning American soldiers' major goal for their nation was wiping out racial and religious bigotry. Native Americans during those days [were subject to varying conditions](#), with the 1934 Wheeler-Howard Act giving them their first light at the end of the tunnel, to only be undermined after the war was over, to intensify in the 1950s. It was not until the 1970s that Native American activism, on the tail of the civil rights days of the 60s, began significantly improving their plight. [\[108\]](#)

The arrival of the white man in the Western Hemisphere spelled the annihilation of native tribes, and even after they were reduced to tiny remnants of their original population, "humanitarians" such as U.S. Senator [Henry Dawes](#) proposed laws that ended up further decimating the natives. The U.S. government practiced involuntary and secret sterilization of native women, forced native children to live in white-run boarding schools to "take the Indian out of them," and other genocidal practices.[\[109\]](#) Even today, the life expectancies of reservation Indians are at Third World rates. In 1980, the life expectancy of a reservation man was 44.6 years, and a few years higher for reservation women.[\[110\]](#) That is an extraordinary number, among the lowest on earth. A nearly thirty-year disparity between two population groups, reservation natives and the general U.S. population, is something not found outside of death camp scenarios.

It is not widely known, but the African slave trade deposited relatively few Africans to North America, less than five percent of the total that came from Africa. That was because the United States was nearly alone in being able to successfully breed slaves. The main determinant was that life expectancy in the United States was among the highest in the world, significantly higher than Europe's. Slaves tended to have life expectancies that paralleled those of the free population, provided they were not considered "expendable," as the [Taino](#) were to the Spaniards. A longer life expectancy among American slaves meant that slave women could have longer and more productive breeding careers (and their masters were more than happy to inseminate them for as long as they could bear children), and therefore America could breed its own slaves, not being as dependent on slave imports as its southern neighbors were. There were other reasons peculiar to the United States' growing slave population, but a longer life expectancy was critical. When the slave trade was outlawed by the civilized nations, one salient reason the United States did not object was that it could keep breeding slaves indefinitely, and they made a legal distinction between Africans who were enslaved in their lifetimes, and Americans who were born into slavery. In 1980, with a nearly thirty-year life expectancy disparity between reservation Indians and the white U.S. population, black life expectancy was "only" 5.6 years behind white life expectancy.[\[111\]](#)

The United States had a challenging time being self-righteous regarding the Nazi activities,

especially when it eagerly [hired death camp Nazis](#) in programs such as Operation Paperclip. Comparisons of the Nazi death camps to the [California Mission system](#) began [as early as 1946](#), when the Nuremberg trials were still being held. World War II's aftermath can be seen as a major event in improving race and ethnic relations in the United States. The struggle was long and hard, but Jews, Native Americans, blacks and other historically disenfranchised groups began making gains after World War II. The Truman administration created numerous commissions that discovered widespread racism and bigotry in America, and made recommendations to end it. The armed forces were officially desegregated in 1948. Jackie Robinson made his debut with the Dodgers in 1947, winning the very first Rookie of the Year Award, an award that was generously handed out to black players for the next decade. Frank Sinatra starred in *The House I Live in* in 1945, which pled for racial and religious tolerance, followed by other movies soon after, which made the same plea, particularly regarding anti-Semitism. Those were precursors to the modern Civil Rights era that largely began in 1954 when the Supreme court struck down legal segregation with the *Brown vs. Board of Education* ruling, and in 1955, when Rosa Parks refused to sit on the back of the bus in Montgomery, Alabama.

The progress was a mixed bag. Much of the progress of the late 1940s was set back by the McCarthy years in the early 1950s, and the assassination of Martin Luther King, Jr. coincided with the end of black economic progress in America. As a ratio to white income, black income increased dramatically from 1940 to 1969, nearly doubling. It has remained stagnant, stuck at around 60%, lower than even the Hispanic income.[\[112\]](#) Down there with the blacks and Hispanics are the natives, probably at the bottom of the barrel.[\[113\]](#) The Sioux reservation on Pine Ridge, site of the [Wounded Knee massacre](#), is in the poorest county in America today.

Native Americans were still subject to Cowboys-and-Indians stereotyping in the movie industry. One remarkable comparison of the recent progress is the two receptions given by the Academy Award audience, a generation apart, when a Native American woman took the stage. When Marlon Brando refused his Oscar for his portrayal of Don Corleone in *The Godfather*, and had a Native American woman read a short speech from Brando, and gave his reason for rejecting the Oscar being the movie industry's horrid depiction of Native Americans, the crowd booed the woman off the stage. Contrast that reaction and its reason to the reception granted a Native American woman who took the stage with Kevin Costner when he accepted the Oscar for best picture for *Dances with Wolves*, less than twenty years after *The Godfather* won best picture. The woman was given a standing ovation.[\[114\]](#)

In World War II's aftermath, the newly formed United Nations actively tried preventing genocidal holocausts from happening again, and the newly coined term "genocide" was the subject of the Genocide Convention. The resolution that emerged from the convention was unanimously adopted by the member states, and soon ratified by all the world's nations, almost. The only significant exception to ratifying the Genocide Convention's resolution, a resolution that was ratified to the extent that it became binding international law in 1951, was

the United States. To this day, the United States has not properly ratified what all the civilized nations of the world rapidly ratified over fifty years ago.[\[115\]](#) Why? Because to do so would make a crime what the United States is still doing to native tribes, what it is doing to Iraq today, what it did to [Southeast Asia](#) and Korea, what it supported in [Central America](#), [East Timor](#), and so on.

The United States is the world's leading practitioner of genocide, and signing on with the rest of the world in denouncing genocide is contrary to the pursuit of our "national interests."[\[116\]](#) In my lifetime, particularly in recent years, the United States has been virtually the only "civilized" nation in the world, and [often the only one](#), to fail to ratify international treaties to preserve the environment (such as the Rio Summit or Basel Convention), outlawing children from becoming soldiers, and so on. No European nation has a death penalty, and the United States is only one of six nations that execute people for crimes committed while they were children. Our august co-executioners are some of the world's most brutal and anti-humanitarian nations: Saudi Arabia, Iran, Yemen, Pakistan and Nigeria. The United States executes more children than all those nations put together, and also has the [world's largest prison population](#) and highest incarceration rate.

Debunking the "Myths"

There is plenty of myth-debunking happening regarding World War II, but many "myth-debunkers" often seemed to be grinding axes, and can be establishment apologists pretending to be myth-debunkers, acting as if they were bringing historical "balance" or "clarity" to the situation, but merely bringing another kind of bias to the table.[\[117\]](#)

David Wyman wrote *The Abandonment of the Jews*, and is considered the pioneer of historical investigation regarding America's reaction to the plight of Jews in the 1930s and through the end of World War II. The thesis of Wyman and numerous others is that the Western nations did almost nothing while the Jewish Holocaust took shape and was carried out. Wyman's work sparked significant scholarly discussion.[\[118\]](#) One response was *The Myth of Rescue* by William Rubinstein.

In the first chapter, Rubinstein surveyed the phenomenon of recent scholarship on the issue of "rescue." He surveyed the vast literature on the subject that has been produced, and told the reader he will demonstrate that all the scholarship that makes the case that the Western world could have done *anything* to minimize the Holocaust is wrong. Rubinstein began his assault on the myths by attacking the first one, the "Myth of Closed Doors, 1933-9." In that chapter, Rubinstein made the case that anti-Semitism was not nearly as pronounced in American society, and European society in general, as Wyman and others would have us believe.

Rubinstein devoted great attention to the notion. He presented tables to show that contrary to the assertion of Wyman and friends, most of Germany's Jews escaped to Western nations before the war broke out, so the closed-door idea is a myth. He presented several tables of numbers to make his case. He presented tables on how many Jews fled Germany, when and where they went, and presented results of public opinion polls on the issue of Jewish immigration and their attitude toward the Nazi regime. With Rubinstein's book as the sole source of information, his thesis might have been convincing. As with [Julian Simon's work](#), reading statistical data needs to be performed carefully, because creative ability can make numbers say almost whatever people want them to, and there are various ways to interpret them. What numbers an author presents and omits can disclose a great deal regarding his/her motivation.

Rubinstein set himself a strenuous task in attempting to puncture the "myths," and the most credible way is to simply present the data, or summarize it for the reader, so that an "objective" assessment of the "myth" could be made. Many times, Rubinstein criticized the "ahistorical" arguments that he challenged. Rubinstein noted that Americans during the Great Depression were averse to letting in immigrants, and "paradoxically" they detested what was happening in Nazi Germany.[\[119\]](#) He presented survey results that showed that on the eve of World War II, most Americans were opposed to an active campaign against Jews in the United States.[\[120\]](#) Rubinstein's equation of American anti-Semitism and revulsion of what the Nazis were doing in Germany was misleading.

Rubinstein was born and raised in America. No nation has ever been as intensely racist for as long as the United States has. Even today, racism and bigotry is alive and well. The wolf has simply donned sheep's clothing. That phenomenon is an old one. For instance, the surest way to get votes in America during the nineteenth century was [running for office as an Indian fighter](#), with Indian killers such as [Andrew Jackson](#), [William Henry Harrison](#) and [Zachary Taylor](#) parlaying their bloody deeds into the presidency, while Custer probably [tried the same thing, and failed](#).

Many people celebrated those gruesome deeds, even universally at times, as in Denver when the conquering heroes came back from [Sand Creek](#). They proudly showed off the severed genitalia of murdered women, wearing it on their hats, while the *Rocky Mountain News* celebrated the events, writing that "Cheyenne scalps are getting as thick as toads in Egypt... Everybody has got one and is anxious to get another to send east."[\[121\]](#) Yet, that did not mean that everybody in America thought it was great. The more "civilized" folks back east, with the local natives long ago annihilated, developed the rudiments of a conscience, and many were shocked at the Sand Creek Massacre. That did not mean that they liked Indians, it just meant that when their fellow citizens indiscriminately killed them, specifically targeting women and children, their sensibilities were offended. Regarding [Iraq](#) today, most Americans prefer to not know about the vast numbers of Iraqi people (largely children) that our policies

are killing. They avert their eyes, and our [mainstream media](#) presents very few images of that carnage. That America has killed off more than a million Iraqis since 1991 is not pretty, but most Americans, if faced with pictures of starving Iraqi infants and pertinent scenes of our "diplomats" helping to create those situations, would not cheer.

We are still an intensely racist nation, but if somebody goes on the American airwaves and calls black people "niggers," they have taken things too far, and will be publicly upbraided. People can be racist and bigoted, but they cannot say it too loudly, or like Rush Limbaugh does, couch it in "humor." Several publicly visible careers have come to a screeching halt in America in the past generation when somebody made a comment that could have been construed as racist (Al Campanis of the Dodgers is one example, Jimmy the Greek another). That such a display would be subject to merciless derision does not conflict with the fact that those witnessing it are racist. It just means that some had the poor taste to say it openly, which is not acceptable in our genteel society, and the anger with which they are attacked is often an aspect of denial coming forward. Ex-KKK Grand Wizard David Duke can even make a respectable showing in a gubernatorial election; he just cannot say the word "nigger" in public.

For instance, if George Bush or Bill Clinton called the Iraqi people "sand niggers" during a press conference, they would have never heard the end of it, and something like that could even create an atmosphere of impeachment. Yet, those two men presided over the deaths of more than a million Iraqi citizens, about half of them children. In America, killing a million people is no crime, something that has barely registered on America's conscience yet, just like our devastation of [Southeast Asia](#) and [Central America](#). Yet, calling those people a racist appellation would bring the American people's wrath. The major crime against humanity passes without mention, or even justified by people such as [Madeleine Albright](#). Call those murdered people a nasty name however, and people invite the wrath of those responsible for the murders.

Rubinstein made much of the fact that Charles Lindbergh ended his political career with a 1941 speech that outlined the threat that Jews posed to America. America acted self-righteously in lambasting Lindbergh for speaking out. His crime was voicing his opinions. How could it be otherwise, when Jews of the day were subject to [discriminatory hiring practices](#) that excluded them from many professions? How could it be otherwise, when they were denied admittance to many hotels, beaches and other public places? How could it be otherwise, when more than half of America believed that Jews should be segregated? Lindbergh was saintly compared to [Henry Ford](#), whom Rubinstein did not mention. There was no widespread boycott of Ford cars due to his attacks on Jews.

Similarly, most Americans did not approve of newsreel footage and reports of Nazi barbarities in the 1930s. It did not mean that most Americans did not have anti-Semitic sentiments. It was just that openly burning books and beating Jews on the street was going too far.

Particularly disheartening was that in 1930s America, about six percent of Americans openly approved of what the Nazis were doing. Rubinstein, however, makes the case that only six percent openly approving of what the Nazis were doing, while 94% disapproved, shows that American was not all that anti-Semitic. That is a questionable analogy, and impressive data regarding American anti-Semitism was completely ignored in *The Myth of Rescue*.

The chapter was titled "The Myth of Closed Doors," because he made the case that the doors were open. He presented statistics that supported his position that anti-Semitism was not pronounced in America. Disapproval of the Nazi book burnings and other barbaric acts provided little evidence for how muted anti-Semitism may have been in America. What it gave evidence of was how many people would approve of open and vicious anti-Semitism, and depressingly, six percent of Americans openly approved of what the Nazis were doing to the Jews.

That would be as if Americans watched the documentary [The Panama Deception](#) and approved of what America did to Panama. It is highly unlikely that even one percent of Americans could watch that documentary and wave the flag over the American invasion of Panama. If it was Italians invading Panama in that documentary, for instance, probably not one American in ten thousand would cheer what happened, and call the Italians unparalleled barbarians. Six percent of Americans openly approved of what the Nazis were doing in the 1930s, and is shockingly high (six percent "strongly" approved for America to begin a similar program, while another six percent "mildly" approved of such plans). Anti-Semitism had to be quite high for people to openly approve such barbarity.

Rubinstein wrote that the data plainly showed that barriers to Jews fleeing Germany after *Kristallnacht* came down in the "democracies" once it became very apparent what the Nazis were doing to the Jews.[\[122\]](#) He tellingly left out facts that would have painted a fuller picture.

The issue is: "Did the 'democracies' let in Jews in numbers great enough to help minimize the Holocaust?" More importantly, what were the intentions of the "democracies" on the eve of war? Did they do all they could, but it was not enough? Also, did they do very little, and if so, how much was due to anti-Semitism and other biases? Those are the important questions that Wyman and others bring up, and are the crux of the matter. Rubinstein continually tried to demonstrate that whatever good intentions the "democracies" may have had, all attempts to act on them would have been uniformly futile.

Rubinstein showed that most German Jews fled Germany before World War II started, more than 80% of Jews under forty years old.[\[123\]](#) That is true. What Rubinstein failed to mention was that those fleeing Jews often did not get where they wanted to, but accepted wherever would take them. For instance, France accepted German-Jew refugees rather readily, until 1938, when it began tightening the screws, as everybody else did, which was contrary to Rubinstein's assertion. Rubinstein mentioned that fact, but then tried mitigating it by showing

that there were between 40,000 and 60,000 Jews in France when war broke out.[\[124\]](#) What Rubinstein failed to mention was that many if not most were trying to go elsewhere, particularly America. That situation existed for all the peripheral nations that took in Jews on the eve of war. America, however, was erecting what Wyman called "paper walls." The world's largest Jewish population was in the United States, and Jews were treated better in the United States than anywhere else in the West. After *Kristallnacht*, the situation of Jews in Germany became increasingly desperate, and the "democracies" moved to limit immigration, not open their doors further. For all the statistical analysis Rubinstein engaged in, he could not obscure that fact, and ignored or minimized events that clearly spelled it out.

Probably the signal event that demonstrated America's attitude toward German Jews fleeing Germany was the fate of the Wagner-Rogers bill, introduced in early 1939. It would have allowed a special allotment of Jewish children into the United States, children who had fled the Third Reich. Those children had been separated from their parents and smuggled out of Germany and Austria. Opposition to the bill was widespread and vociferous in America, even though America's newspapers nearly all took the editorial stance of supporting the bill.[\[125\]](#) President Roosevelt's cousin even stated that 20,000 charming children would all too soon grow to be "20,000 ugly adults." Roosevelt bowed before the public outpouring of sentiment, and let the bill die quietly, taking no action.[\[126\]](#) That was the salient and pertinent opinion poll of the day, and Rubinstein did not mention it. Faced with an unavoidable decision to take in Jewish refugee children, America slammed the door. The next year, legislation to take in English children refugees passed with enthusiasm.

The other event, on the eve of war, after *Kristallnacht*, was barely mentioned by Rubinstein, and he used it to criticize critics of the West's role in the Jewish Holocaust. The horrific voyage of the *Saint Louis* is a monument to the West's attitude toward the Jewish plight on the eve of war. It was an acid test of the West's attitude, but Rubinstein kept throwing numbers at the reader, diverting their attention from the entrenched anti-Semitism that pervaded the West at that time.

The *Saint Louis*' voyage is also an example of the hazards of relying on secondary historical accounts. In Yahil's *The Holocaust*, she wrote that not all the passengers aboard the *Saint Louis* were taken in and some sailed back to Hamburg.[\[127\]](#) For years, I believed that was the case. While researching this essay, I saw other scholars say that *all* the passengers were taken in by the nations of Britain, Holland, Belgium and France. In order to resolve the discrepancy, I had to dig up an authoritative work on the *Saint Louis*' voyage, and obtained *Voyage of the Damned* by Gordon Thomas and Max Morgan-Witts, and I found that those nations indeed took in all passengers. Yahil's account was wrong, and for years, I was misled. That is the hazard of relying on secondary history. In my work, I usually do not make historical assertions, especially when relying on secondary history, unless I see a number of sources agree on the events. The fact that all the passengers were taken in instead of some sailing to Hamburg is significant. It does say something about the Allies. Yet, reading the

voyage's account is sobering. In the United States, news accounts and editorials in American newspapers ran while the ship was stranded in Havana harbor. The Cubans were derided by numerous American papers for not letting them in, and the *Christian Science Monitor* castigated the passengers of the *Saint Louis* for being so selective about their destination, invoking the image of pioneers carving their homes out of the wilderness, and reminding the Jews to consider that option.[\[128\]](#)

The *Christian Science Monitor* conveniently ignored that Jews had been doing *exactly that* in Palestine, and that there was not another option like that in the world, and by that time Palestine had been closed off as a destination by British restrictions. In 1939, on the eve of war, Jews fleeing Germany comprised more than half of all immigration to Palestine, the highest proportion of any pre-War year, but the number of Jews immigrating to Palestine from Germany in 1939, 8500, was less than immigrated each year from 1934-1936. The British clamped down on immigration after anti-Jewish riots by Palestinian Arabs in 1936. Britain's relative openness to Jewish immigration was partly due to the fact that they did not want them immigrating to Palestine, another point glossed over by Rubinstein. However, Rubinstein does score some points when he pointed out that many German Jews did not go to Palestine when they may have been able to. There is truth to that, which partly had to do with the anti-Zionist element in Jewish circles. Not everybody wanted to go to the Promised Land. When the *Saint Louis* sailed, however, Palestine apparently was not an option.

Another unmentioned event did serious damage to Rubinstein's thesis, which was the voyage of the *SS Struma*. In December 1941, the ship was filled with 769 Romanian Jews at port in Istanbul. The ship was not seaworthy, but those Jews were desperately fleeing to wherever they could. Turkey was another "neutral" power during World War II. The ship lay in Istanbul's harbor for more than two months, and the British denied them permission to continue to Palestine. On February 24, 1942, the Turkish government ordered the ship to leave and the *Struma* was towed out into the Black Sea, where a Russian submarine sunk it by torpedo, apparently by accident. Two people survived that sinking. Raul Hilberg wrote of the incident, "The Balkan area had a large Jewish population, and henceforth the Turkish government needed no confirmation of Britain's policy to frustrate the immigration of these Jews to Palestine."[\[129\]](#)

The detailed account of the *Saint Louis'* voyage is a searing reflection on the United States and the West. One of the *Saint Louis* passengers, Aaron Pozner, was a stowaway who had been incredibly kicked out of Dachau with a small group of men who were told that they could leave Dachau if they left Germany in two weeks. Pozner made his way to Hamburg and hid in a stack of curing animal hides on the waterfront, enduring that awesome stench. Pozner saw prisoners regularly executed in Dachau by fiendish methods. One guard specialized in castration by bayonet. Hiding in curing hides was a minor inconvenience compared to the rigors of Dachau. Other *Saint Louis* passengers were beaten by gangs of SS soldiers on their way to the boat.

Yahil's account was not as wrong as it first appeared. When the *Saint Louis* had the door slammed in its face in Havana, its sister ship the *Orinoco* was sailing from Hamburg with 200 Jewish refugees, following the *Saint Louis'* example. Seeing what happened to the *Saint Louis*, the *Orinoco* *did* return to Hamburg. The only intervention the West apparently took regarding the *Orinoco's* voyage was taken by the U.S. ambassador to Britain, Joe Kennedy, who informally warned Hitler to refrain from seizing those passengers when they disembarked in Hamburg and throwing them into concentration camps. The Germans apparently took Kennedy's threat seriously, because those hapless *Orinoco* passengers went home unmolested...although they likely ended up in concentration camps before it was all over.^[130] Britain and France flatly rejected taking in the passengers of the *Orinoco*.

The *Saint Louis'* plight was so dire, with the situation of finding no safe harbor, that those aboard made several suicide attempts, by poisoning, slashing their wrists, jumping overboard and hanging themselves. A few attempts were successful, and there was genuine fear that the passengers would stage a Masada-like mass suicide, so there was a constant suicide watch on deck. While that was going on, there were desperate negotiations taking place to get some nation to take them in. In the Western Hemisphere, there were a few offers of dubious nature, by the Dominican Republic, Honduras and the Panama Canal Zone. There was a great deal of lobbying in the United States by Jewish groups, but America slammed the door hard, although many passengers had U.S. quota numbers. When the *Saint Louis* set sail for Europe, it sailed up the Florida coast, in sight of Miami. A U.S. Coast Guard ship escorted the *Saint Louis* as it sailed along the American coast. Why did it escort the *Saint Louis*? The fear was that Jews would jump ship and try swimming to America's shores. The Coast Guard was under orders to look for Jews jumping overboard, capturing them and redepositing them back aboard the *Saint Louis*.

When those four European nations were finally persuaded to take in the refugees, only after being paid about \$500,000 by Jewish groups, they nearly battled each other in getting the passengers with the lowest quota numbers for the United States, so they could quickly get rid of them. Holland interned the Jews with other Jews who were trying to flee Europe, made clear that their asylum was only temporary, and they refused any passenger who did not have a U.S. quota number. The internment camp in Holland was surrounded by barbed wire and was watched by guard dogs. The passengers who disembarked in Belgium were viewed with great distrust, and essentially treated like prisoners. France welcomed the Jews relatively graciously, yet were in almost open contest with Britain to take in Jews with the lowest U.S. quota numbers. When the final stop was made in England, about sixty of the men were immediately interned in a camp of about 5000 Jews, all hoping to go somewhere, anywhere, that would take them.

The *Saint Louis* Jews who went to Belgium, Holland and France mostly ended up in death camps before it was all over. If America had taken them in, they would have survived. The voyage of the *Saint Louis* alone renders highly dubious Rubinstein's "myth of closed doors"

argument. The ill-fated Wagner-Rogers bill, that Rubinstein did not mention, deals his arguments a fatal blow.

To gain a fleshed out understanding of the situation, watch the documentary *America and the Holocaust; Deceit and Indifference*. It features the real story of Kurt Klein and his parents. As with many German Jews, the Klein family first got their children out of the country, then planned to follow them when they could. After *Kristallnacht* in November of 1938, the Klein parents were in the long line of Jews trying to escape to America. In December of 1938, the Kleins were part of a horde of Jews besieging the American consulate in Stuttgart. They were in line to get out of Germany and into America, but were informed that there were over 22,000 cases ahead of them. The waiting list was more than two years long.

In August 1940, after nearly two years of waiting, the Stuttgart consulate revoked the Klein's tentative approval for immigration. Soon after the American consulate in Stuttgart slammed the doors in their faces, they were deported by Germany to Vichy France, and took up the immigration issue anew with the American consulate in Marseilles. Vichy France was not occupied by the Nazis, but collaborated with them. The Kleins were *kicked out* of Germany, not put into concentration camps. The Kleins lived in an abysmal refugee detention camp, given starvation rations, and desperately sought a way to America. By that time, the American [State Department was acting very consciously to limit Jewish immigration to America](#). That was when the "paper walls" escalated and eventually cut off almost all Jewish refugees from coming to America. That situation was a primary issue that Wyman investigated.

In July of 1941, nearly *two years* into World War II, the American consulate again informed the Kleins that all their previous efforts to immigrate were for naught, and that they would have to start over. The Kleins were also forced to live apart in the refugee camp. In December of 1941, a few days before the Japanese bombed Pearl Harbor, the Kleins had their last glimpse of freedom. Their children had been able to book them passage to America. All was in readiness, except for approval from the American consulate. The consulate informed the Kleins that the quota for German immigrants had been exceeded, and that they would have to wait for the quota to open up to admit them. By that time, the Final Solution was underway in Eastern Europe, with the Einsatzgruppen performing their mass executions in the newly conquered territory, as Germany invaded Eastern Europe during the double-cross of Stalin.

After the final failed attempt in December 1941, after *three years* of desperate attempts to gain entry to the United States, the Klein children stopped hearing from their parents. Their mail to their parents was eventually returned to them undeliverable, and after the war it became known that the Klein parents were sent to Auschwitz in August of 1942.

That can disparagingly be called an "anecdote," although a heart-wrenching one. About 100,000 Jews in peripheral nations to Germany were in the same situation as the Kleins were. How many Jews saw the impossibly long waiting line into America, and did not even try? In

his debunking of the "myth of closed doors," Rubinstein puts in several anecdotes, but of a very different nature. His anecdotes are all about how nobody thought the Jewish Holocaust would happen, which was why many German Jews did not emigrate when they had the chance. His anecdotes were about how much everybody hated Nazi Germany. Again, hating Nazis did not mean that they loved Jews.

The 1936 Olympics were staged in Berlin, and there was little outrage over it. America participated in it, Jesse Owens became a legend, and the Olympics were a huge propaganda coup for Germany, as the American press generally wrote glowing accounts about Nazi Germany. The Jewish issue was nearly invisible in the American press during the Olympic coverage. Although Jewish and other groups tried to organize a boycott of the Berlin Olympics, one never happened, and prominent Olympic officials such as Avery Brundage even spoke out against the Jewish-led attempts to form a boycott. America did not enter the war until the Japanese were egged into [bombing Pearl Harbor](#), and Germany *declared war on America*, when the European war was more than two years old.

The single most respected work of scholarship on American anti-Semitism is Leonard Dinnerstein's *Anti-Semitism in America*, published in 1994, three years before *The Myth of Rescue* appeared. *Anti-Semitism in America* is considered the first comprehensive treatment of American anti-Semitism's history. Rubinstein's treatment of Dinnerstein's work reminded me of the JFK assassination debunking by [Gerald Posner](#), where the *appearance* of dealing with the all the pertinent evidence was feigned. Posner would dismiss entire bodies of work with footnotes, while plowing to his foregone conclusion that Oswald was a lone nut who was murdered by another lone nut. The only mention of *Anti-Semitism in America* in Rubinstein's book was in a footnote, where he dismissed Dinnerstein's work as being unbalanced and failing to note how much Americans were opposed to the Nazis. Rubinstein tried linking shock and disgust with what the Nazis were doing with love for the Jews (literally, "philo-Semitism").
[\[131\]](#)

Another book cripples Rubinstein's "open doors" thesis. Mitchell Bard's harrowing *Forgotten Victims* is the story of *Americans* who ended up in the death camps. As with stories like it, denial has been the prominent American reaction to the plight of American citizens, many not even Jewish, who ended up in the death camps, including American soldiers. Bard's work is the first to try summarizing the experience of Americans in the Final Solution. Bard remarked on the paucity of documentation on the subject, as he sifted through archives, hunting down and interviewing survivors.

As can be seen in many other war accounts, Bard shows how the Red Cross had a hand in the Jewish Holocaust, as it accepted at face value the Nazi explanations for why Jewish prisoners were segregated from the general prison populations, and never really spoke out about the holocaust that was obvious to its people in the field, visiting the concentration camps. The official explanation was that they were afraid to jeopardize access to the camps if they spoke

out. The head of the Red Cross even used the term "the Jewish Problem," the phrase the Nazis used.[\[132\]](#)

The Red Cross' timid silence and acquiescence is another dark chapter of the Jewish Holocaust. The aspect of Bard's book which further eradicates Rubinstein's "open doors" thesis is recording how the United States prevented *fleeing Americans* from coming back from Europe. In 1939, about 80,000 Americans were living abroad, tens of thousands in Europe. On November 25, 1939, only a few months into World War II, the assistant Secretary of State, George Messersmith, wrote that Americans living abroad who were not planning on returning could not expect any help from the U.S. government if they became ensnared in war zones. Messersmith wrote,

"Their real status does not differ very much from that of the many thousands of unfortunate persons deserving of our sympathy, and having no claim to American citizenship, who would desire to come to this country in order to escape from danger zones or for other reasons and who seek immigration visas and passport visas to that end...This government considers that by reason of having already met this particular responsibility, no situation should arise, even if conditions should become more aggravated in certain places, that would warrant it in providing further special facilities to enable Americans to return to this country."[\[133\]](#)

Bard wrote that Messersmith's attitude "would condemn hundreds of Americans to death." The Germans regarded any Jew, regardless of their nationality, as fair game. When the Germans began requiring American Jews to register in occupied France, William Leahy, the ambassador to France at the time, protested, and the Germans stated that it was required to "ensure the recovery of the country." America apparently did nothing. Americans caught in German-occupied Europe were often given special consideration, while America was officially neutral. In January of 1941, American Jews in Hungary became subject to new anti-Jewish laws. The American government was again virtually inert.

When America closed German consulates in America in the summer of 1941, the Germans retaliated by closing American consulates in occupied territory. American business was conducted through the Swiss Legation after that. When Jewish property was seized in Hungary, the State department specifically did not support the claims of Jews living in America if they had not yet earned American citizenship.[\[134\]](#)

When Americans began getting rounded up in Romania, and Cordell Hull, the Secretary of State, was informed of the Final Solution being carried out in Romania, with Americans being deported to Eastern Europe, where their fate was uncertain (we know today that it was pretty

certain), Hull responded like the bureaucrat he was, and allowed some small deviation from policy to provide passports to American-Jews who were in threat of being rounded up with the other Jews. Nothing was suggested for helping the non-American Jews.[\[135\]](#)

In the day's correspondence, the State Department's attitude was clear. Cavendish Cannon, of the State Department's Division of European Affairs, objected to the plan to rescue Jews from Romania because it would encourage other persecuted people to seek refuge in the United States. Many in the State Department, who thought that rescuing Jews would pose a danger or "take the burden or the curse off Hitler", held Cannon's attitude.[\[136\]](#)

Breckenridge Long, a prominent villain in the Jewish plight and America's response to it, proposed to not only restrict immigration to America by refugees, but also for *American citizens*, citing that they could really be spies and subversives, keeping in line with the "Fifth Column" fears of the day, which were exaggerated. Long even wrote that not all Americans wanting to come home would be allowed in, stating that, "only those we want should be accepted."[\[137\]](#) If Long felt that way about *American citizens* who wanted to come back to America, what chance did Jews of European citizenship have? That situation prodded David Wyman into writing *The Abandonment of the Jews*.

In January 1943, the U.S. government discovered that American Jews in France were being treated just like other Jews in France, and our government gave a tepid response that the Germans had better watch out, or Germans in American hands might suffer. In September 1944, 30,000 Americans were still in Europe. American Jews in the internment camps were treated worse than the others, and Americans began ending up in concentration camps.

Bard relates the tale of Barry Spanjaard. Spanjaard was only ten years old in 1940. He was born in America, but his parents were Dutch. The American consul told Barry to return to America and leave his parents behind in Europe. Given that choice, Barry stayed with his parents. Spanjaard had his birth certificate, but not a U.S. passport. Because he did not have a passport, the Germans deported him and his parents to Bergen-Belsen, where they spent the next year. In January of 1945, the Germans let Barry and his parents go free. Barry carried out his father, who weighed sixty-five pounds by that time. They headed for Switzerland, but his father died a few days later. Years later, Barry learned that the Germans had tried to trade him to America for a German, and our government refused. Barry later fought in the Korean War, and when he found out about how his government refused to trade for him, he said that he would have never gone in the American military to fight "for this country" if he knew that then. Barry witnessed his father being beaten and other horrors. As an American, he had a somewhat privileged status at Bergen-Belsen: he was not forced to beat his inmates, as other boys were.[\[138\]](#)

Bard believes that hundreds, if not thousands, of Americans would have had their lives spared if our government had done anything substantial about it, instead of erecting "paper walls" for

American citizens. In one instance, the American government demanded that an intern at Auschwitz produce proof of citizenship before they would help. Those stonewalling behaviors condemned many Americans to death in the camps.[\[139\]](#)

Ancillary to the point of demonstrating how untenable Rubinstein's "open doors" thesis is, below is some more of Bard's devastating book. American citizens ended up in the Warsaw ghetto, and Bard recounts the story of Mary Berg, an American teenager who lived in the Warsaw Ghetto for more than two years. Berg wrote a diary that is a much different account than Anne Frank's. Frank hid in a house in Holland. Berg walked the streets of the Warsaw Ghetto daily, witnessing the death and suffering that surrounded her.

Jewish-American soldiers wore dog tags with an "H" on it, identifying their religion as Hebrew. The "H" was officially so their spiritual rites could be ministered properly. The problem was, however, that a Jewish-American soldier could go his entire tour of duty and never see a rabbi. The "H" became a bull's-eye for Jewish-American soldiers who had been captured by the Germans. Their buddies often tried hiding them by swapping dog tags, giving them their Bibles, and the like.

American soldiers ended up at Buchenwald and Mauthausen. Perhaps three hundred American soldiers went to Buchenwald. Most lived to tell about it, but many also died. Most were not Jewish. Many ended up at Mauthausen, which was perhaps worse than Auschwitz. Mauthausen was where the Nazis engaged in the infamous practice of forcing the prisoners to haul stones. Prisoners were forced to carry huge stones up the 148 steps of the quarry, then rush back down to haul another one back up, over and over, until they died. American soldiers were forced into that duty. The Nazis would execute their collapsed rock-haulers on the spot, including American soldiers. Bard gives an example of one day, September 5, 1944, when Dutch, English and American POWs arrived at Mauthausen. They spent the first day getting baths and being assigned barracks. The next day they carried stones all day long, and then were all shot, the same day.[\[140\]](#) American soldiers would die by beating and torture during interrogation, their bodies being fed to the crematorium.

OSS (Office of Strategic Services, the forerunner of the [CIA](#)) Lieutenant Jack Taylor ran numerous special American missions behind enemy lines, but was finally captured and ended up at Mauthausen. Taylor was slated for execution, but was assigned to a work detail to build a crematorium. Taylor endured unimaginable horror, with fellow prisoners resorting to cannibalism. Because he was an American, other prisoners used him as a repository so he could tell the stories of what happened, as he had a better chance of surviving than they did. He was told of human experiments and executions by every means imaginable, such as being shot, gassed, hanged, beaten with sticks, hammers, pickaxes and shovels; being torn apart by dogs, forced off of cliffs, injected with chemicals in human experiments, drowned, crushed in cement mixers, buried alive, eyes gouged out, red hot pokers shoved down their throats, etc. Taylor saw enough himself that nothing they could say amazed him.

Human experiments were routinely carried out, and prisoners with unusual features were killed and their unusual features preserved, such as tattoos, strange lesions and deformities. A doctor told Taylor that "A hunchback and a dwarf, who had come to the notice of one of the SS doctors, were executed and their skeletons cleaned and mounted for specimens."[\[141\]](#)

Taylor survived Mauthausen and was freed when the camp was liberated. He is a prominent witness, and Mauthausen was not even an extermination camp. Testimony like Taylor's is difficult for [Holocaust deniers](#) to tear apart as Jewish propaganda, especially American-flag-waving Holocaust deniers.

Bard spends more of his book on a group of American prisoners who had it probably worse than any other group of American POWs in Europe. In late 1944, the Germans made their last desperate offensive, known as the Battle of the Bulge. They took the American troops by surprise and captured thousands of American troops. They slaughtered many American prisoners at what became known as the Malmédy Massacre, where the SS again demonstrated their heroic penchant for executing unarmed prisoners. The Nazis tried separating the Jewish-American soldiers from the four thousand soldiers they captured. Again, their buddies tried hiding them, but with threats the Nazis were able to get 130 Jewish-American soldiers to identify themselves. They took those 130 soldiers, added 220 other soldiers from the ranks, and sent them off by train to Berga, a camp that would have the highest mortality rate of any POW camp during the war. Berga was a slave labor camp, where the soldiers were forced into mining activities. They were starved and worked to death for fifty days, then the Allied armies drew close and the survivors were sent on a death march, just as Jews were being marched around the countryside in those last days. When their guards finally abandoned them, U.S. soldiers, who could not believe at first that those human skeletons were American soldiers, discovered them. More than 70 of those 350 soldiers died in the span of two months. They had been reduced to the same "subhuman" condition that Patton said the Jews in the concentration camps had been reduced to.[\[142\]](#) While in their ghastly prison conditions, the esprit de corps deteriorated a little, and stealing from each other was what most soldiers did, as their survival partly depended on it. They always wore all their clothes, because they would disappear if they took them off. One soldier awoke to find a buddy trying to take his boots off his feet while he slept.

America's response to Berga was typical: denial. The army went so far as to send one survivor to a psychiatrist, saying that he had to be making up his story of Berga. When a soldier who survived Buchenwald applied for assistance at a VA hospital, the doctor who interviewed him wrote in his record, "Claims he was in Buchenwald." Another Buchenwald survivor was told by the Air Force Records Center that there was no record of him being a POW. When he wrote to federal agencies, their reply was invariably: "There were no Allied airmen at Buchenwald." The government made returning POWs sign secrecy agreements, further paving the way to burying their story. To this day, the U.S. government is trying to cover up what happened. Until recently, the survivors of the other four thousand Battle of the

Bulge POWs who remained after the 350 prisoners were separated and sent to Berga, knew nothing about where those 350 soldiers went, or their fate. The survivors often have their experiences received with disbelief when they bring them up, so they keep silent.

The two fiends who ran the camp at Berga were prosecuted in the war crimes trials, but the American soldiers' testimonies were generally not entered into evidence, and those two had their convictions commuted, to the bitterness of many surviving soldiers. As with most who survive such ordeals, the men were not eager to relive the experience by talking about it, and most people did not want to hear it. Many of those men to this day have trouble coming to grips with their Berga experience, and many are still crippled in one way or another.

In his first chapter of debunking the "myth," Rubinstein's thesis collapsed. He was obviously an apologist posing as a myth debunker. Rubinstein's efforts in his other chapters fared similarly under scrutiny. This essay will present one more example.

Rubinstein devotes a chapter to exploding the "myth" that the allies could have bombed Auschwitz. If something that was seemingly well intended could have been done, Rubinstein went to lengths to show how it would not have helped. At every turn, he absolved American and Allied inaction. Rubinstein's strategy was showing that any plans would have been ineffective, or they had been enacted, they would have been too late, etc. In Rubinstein's view, the Americans and the Allies were full of good intentions, but were helpless in the face of Nazi evil. He castigated others repeatedly for their hindsight, proposing things today that nobody proposed back then, but when he dealt with things that *were* proposed back then, Rubinstein used hindsight himself to show how even if the Allies had tried to bomb Auschwitz, it probably would have saved few Jews, from what we know today.

When Rubinstein noted that nothing was proposed or a proposal rejected, such as the ransom of 70,000 Romanian Jews by the Nazis, Rubinstein ignored the anti-Semitism that likely fueled the rejection, and instead showed that even if attempted, it would have been futile.

When something was proposed and ignored, such as bombing the crematorium at Auschwitz, Rubinstein then showed how the inaction was somehow justified because it would not have mattered if they tried anyway, because of logistical problems or that it was too late. Rubinstein seemed to have completely ignored the entire purpose of the work of Wyman and others (even though he stated that his work was a response to Wyman's), which is basically, "What can we learn from those events to prevent it from happening in the future?" On that score, Rubinstein provided no answers and heaps all the blame for the Holocaust on Hitler's and his cronies' shoulders. Rubinstein emphasized *one* "feasible" solution not tried: assassinating Hitler.

For another example of Rubinstein's tactics, he made a bold statement on page 84:

"Not one plan or proposal, made anywhere in the democracies by either Jews or non-Jewish champions of the Jews once the mass murder of the Jews in Europe had begun, could have rescued one single Jew who perished in the Nazi Holocaust."

The parents of Kurt Klein were just two of many thousands of Jews who tried getting out of Europe but were stymied by the "paper walls." The Kleins died in Auschwitz. Rubinstein can probably argue that those *Saint Louis* passengers who died in the death camps, in spite of the desperate actions by Jewish organizations and others to get those people into America, were stranded in Europe *before* the Final Solution was carried out.

One issue that Rubinstein failed to deal with, and others have mentioned this "lapse" in his logic, was that many plans would have been proposed if the proponents felt that they had a prayer at being implemented in the day's political climate. For instance, most American Jews would have wanted Kurt Klein's parents to be able to come to America, and there in fact were attempts to raise immigration quotas, but when the most innocent of victims, Jewish children, were given the cold shoulder by America when the [Wagner-Rogers bill died](#), how realistic was it to campaign to let in more Jewish *adults*? Jews in America at times did not want more Jews being let into the United States, because every Jewish refugee admitted further fanned American anti-Semitism.[\[143\]](#) The Jewish groups themselves have been roundly criticized by many for doing very little to avert the fate of those in the Jewish Holocaust. Kurt Klein, as a teenager, even naïvely went to Washington D.C. himself and pled with the government to do something about his parents' plight. His response to Rubinstein's assessment might be intriguing.

Regarding Auschwitz particularly, Rubinstein devoted a chapter to debunking the notion that bombing Auschwitz would have been helpful or even really possible. Early in his Auschwitz chapter, Rubinstein flatly states,

"As we have seen from the detailed discussions of the plans for 'rescue' actually put forward during the war, the bombing of Auschwitz was never, at any time, included among the proposals made by Jewish or non-Jewish groups concerned with the plight of Europe's Jews."[\[144\]](#)

In the pages after that unequivocal statement, Rubinstein discusses the *proposals for the bombing of Auschwitz* that were made by "Jewish and non-Jewish groups," noting the

individuals who originally presented pleas to bomb the railroads leading to Auschwitz, then the proposals put forth by groups to bomb Auschwitz itself, again by various concerned groups, both Jewish and non-Jewish. He even mentions how the War Refugee Board initially rejected the idea of bombing Auschwitz in August 1944, to eventually make the suggestion tentatively in October and emphatically in November.[\[145\]](#) That hardly jibes with Rubinstein's statement that nobody ever proposed to bomb Auschwitz.

Then Rubinstein made the case that when the proposal to bomb Auschwitz was made, it was too late to do any good. In particular, Rubinstein assailed Wyman's notion that the Allies could have successfully bombed Auschwitz, and he cited expert critiques of Wyman's work, and concluded that bombing Auschwitz was not feasible.

Rubinstein, while doing zero original work on the subject, nearly hung his hat on the analyses of James Kitchens and Richard Levy, noting that their analyses devastate Wyman's analysis.[\[146\]](#) The last word today on the issue is the analysis done by Stuart G. Erdheim, who argues more convincingly than Levy and Kitchens that yes, Auschwitz could have readily been bombed if the Allies had made it a priority.[\[147\]](#) Erdheim essentially takes apart the arguments of Kitchens and Levy. According to Robert Herzstein, he asked Levy the Auschwitz bombing question after Levy had given a speech at the Holocaust Museum. Levy's immediate response was that the allies could have "plastered" Auschwitz.[\[148\]](#) I do not advocate any violent solutions, but bombing the crematoria at Auschwitz would have killed very few people if done during the daytime when the Jews were working outside the camps. The issue here is whether Rubinstein disposed of another myth. He tried to, but had dubious success. His entire book is like that, and is the most prominent response to Wyman's work.

Why write history? What is history good for? To understand what happened, in order to apply the lessons to today, and perhaps avoiding the same mistakes from being repeated? [That is my view](#). Rubinstein regularly mentioned the "ahistorical" nature of the work he critiqued. Rubinstein concludes his book with the sentiment that the "democracies" did all they could to prevent or minimize the Jewish Holocaust, which was nearly nothing at all, because nothing was possible. He finishes with,

"Conversely, it cannot be emphasized too strongly that responsibility for the Holocaust lies solely and wholly with Adolf Hitler, the SS and their accomplices, and with no one else. In searching for a rational explanation of modern history's greatest crime, it is important that we do not assign guilt to those who were innocent."[\[149\]](#)

With that finale, Rubinstein takes the lawyer's position, making a select few culpable, and exonerating everybody else. It is an example of the "head-on-a-platter" theory. In that perspective, there are only a few bad guys in the world, making victims of the rest of us. The system or general populace is never responsible for bad things happening - it is only a few bad apples, the standard establishment apologist rationale. There is nothing to reform, because everything works fine. If something such a holocaust or Watergate happens, it is because a few bad people brought it into being.[\[150\]](#) In a sense, it is almost the conspiracy theorist's worldview. The institutional analysis of people such as [Edward Herman](#), [Noam Chomsky](#) and [Howard Zinn](#) are anathema to establishment apologists. The Chomsky-types spread wide the responsibility for mass events such as the Jewish Holocaust. They understand that making a few people the only guilty parties avoids the main issue, which is that each one of us become a little introspective, asking ourselves what we can do to help make sure such events never happen. Rubinstein's has a lawyer's view of the world, assessing guilt to the open perpetrators, sometimes, while exonerating the larger dynamics that helped it happen.

Rubinstein ignored the thousand years of anti-Semitism in the West as a contributing factor, and its steep climb during the 1930s and 1940s. Rubinstein also ignored the geopolitical factors that stunted Germany's imperial ambition, including the humiliation and deliberate lack of understanding shown by the other Western nations for why World War I happened. Invisible to Rubinstein is the thousand years of nearly continual warfare that characterized the West, and how such a culture of violence helped spawn such ideas as the Final Solution, a plan that was not hatched until the insanity of war gripped Germany and they began losing. Rubinstein may argue that such an analysis is beyond the scope of his work, but his work is little or no help in understanding why holocausts happen or how to prevent future ones.

Hindsight can be misused, and all the Monday-morning quarterbacking that people have used regarding the Jewish Holocaust and many other events can be a dubious undertaking. Yet, should not the point should be this: "What could we have done?" Even if such acts may partly be wishful thinking in hindsight, can it be a valuable process of understanding what happened, and preventing it from happening again? It is in that spirit that I wholly approve of the work of Wyman and others like him. The [presentism](#) arguments have a certain merit, especially when trying to make FDR more culpable for the Jewish Holocaust than he really was. For his time, FDR was a Jew-lover, placing many Jews in his administration, which engendered a lot of animosity and fear in America, where many called his New Deal the "Jew Deal." FDR was a politician for sure, and he bowed to the winds of public opinion often. Blaming FDR for America's inaction during the Jewish Holocaust is related to blaming Hitler for the Jewish Holocaust. That mentality is "blame the leaders, exonerate the herd." No U.S. president has ever been a visionary leader. That is not how American politics works.

Perhaps the closest thing that America has had to a visionary president was JFK, but that is also a mixed bag. He made visionary statements that inspired millions of Americans, such as his [landing-on-the-moon-by-1970](#) speech, his "What can you do for your country?" speech, his

[Peace Corps](#) and New Frontier ideas, etc. Kennedy did not dream it all up himself. He had speechwriters and advisers who helped polish that image. He was a politician also, and reading the record on his administration is not always pleasant. He was not exactly at the forefront of the Civil Rights issue, but played the politician, bowing to the winds of change, trying to seem like a leader when it was advantageous. He was close buddies with Joe McCarthy, for instance, and agreed with the witch-hunt mentality that prevailed during the McCarthy days. Kennedy presided over the beginning of the Vietnam War.

[JFK was probably killed](#) because he ticked off some pretty powerful people, and had to go. Noam Chomsky will disagree with me here, but it looks like JFK's decidedly tame outlook ticked off the hawks in the military and other high places. He would not call in air support for the Bay of Pigs invasion, refused to invade Cuba over the Missile Crisis, over the protestations of his advisers, and was making noises about pulling out of Vietnam. Busting the Mafia made him hated in those circles, and they had a hand in his death.

Jack Ruby was far from the small time nightclub owner that people such as Gerald Posner made him out to be. Gary Wean saw Ruby in the company of [Mick Cohen](#) more than once, and Wean once had a conversation with Ruby where he frankly told Gary, even knowing that Gary was a cop, that the mob was moving its operations to Havana, where all the action was. Castro's revolution ended that, which was one reason that JFK was killed, according to my research. Kennedy was not exactly a Christ-like figure, but he was not nearly as bellicose as the hawks would have liked. The Eisenhower years were characterized by Secretary of State John Foster Dulles, whose notion of diplomacy with the Soviets was to continually threaten nuclear war. Dulles' "diplomacy" coined the term "[brinksmanship](#)." Kennedy was far too gentle for that kind of stance, and it probably led to his death.

Winnowing the innocent from the guilty is a nearly pointless exercise in the end. The question that always faces us is this: "What will I do?" We face it each and every day, and our collective answer to that question determines [what kind of world we live in](#). It is lunacy to argue that the day's anti-Semitism, which pervaded the West, had nothing to do with the Jewish Holocaust, except in Hitler's fevered mind. It is lunacy to argue that the West's constant war-like mentality had nothing to do with what happened during World War II. It is blind to not consider the political-economic realities that led a Hitler to come to power, realities that every single citizen of the West had a hand in, to one degree or another. This site's [spiritual essay](#) makes the case for that being literally true.

It is annoying when people "debunk" myths, acting as if they are objective, when they are really performing apologetics. There is probably no true objectivity anywhere. There are personal truths, national truths, and even universal truths, but each one is at least partly dependent on who is perceiving the truth, making it their own truth. I am not objective. I am not even disinterested, which is the ideal historian's perspective, in many circles. Mitchell Bard, for instance, is far harder on Rubinstein's work than this essay has been. A review by

Robert Herzstein was scathing.[\[151\]](#) The point of scholarship such as Wyman's is that few people really *cared* about what happened to the Jews, which was the primary reason for the inaction. That is the central point and the one to argue with, which Rubinstein does not really address.

In support of Rubinstein's thesis, once the stage had been set, through:

1. Long centuries of anti-Semitism that had caused Eastern Europe to be so highly populated with Jews;
2. The incessant warring of the European nations for a millennium;
3. The stunting of Germany's imperial ambition by the other imperial powers that led to World War I, and them deciding to punish Germany instead of trying to get of the root of the problem, which is imperial ambition itself;
4. The subsequent economic hardships of war reparations, hyperinflation and the Great Depression that allowed Hitler to come to power; and
5. For the Jews of Western Europe in particular, the stage was further set through the other Western nations barring/limiting the immigration of fleeing Jews;

then when Germany invaded Poland and eventually Eastern Europe, those Jews in those regions *were* largely doomed, although many in the local populations were willing accomplices, eagerly moving into empty Jewish homes, hunting Jews, etc. If the Allies had committed themselves to trying to mitigate the Jewish Holocaust, and there is no evidence that they did to any significant degree, it is questionable how successful they would have been. Yet, that is also a judgment in hindsight. Regarding bombing Auschwitz and other potential attempts to mitigate the Jewish Holocaust, such as buying those Romanian refugees, there is no evidence that they were taken seriously. With the Romanian Jew purchase, the American and British bureaucrats were genuinely *afraid* that the Nazis would actually sell them, putting tens of thousands of refugees in their hands. In the end, the Allies simply *did not care* what was happening to the Jews, as they also did not care if millions of Soviet soldiers were dying in Nazi POW camps as part of a conscious Nazi strategy. In light of the firebombings of Dresden and Tokyo in early 1945, the atomic bombing [Nagasaki](#) *after* Hiroshima, then having a "[grand finale](#)" bombing *after* that, as the Japanese were trying to surrender, gives the lie to the notion that the war planners had much concern for civilian lives. In the insanity and horror of the times, the Jewish fate was simply part of the landscape. As Hilberg observed, the Allies were only really concerned with the success or failure of the combatants, and victims such as Jews, Poles and Soviet POWs were barely considered among the Allied press and governments.[\[152\]](#)

Yes, those European Jews were doomed once the fireworks began, but to ignore all the

factors that led to that situation was the fatal flaw in Rubinstein's work, as he heaped all the blame for the Jewish Holocaust on a few shoulders, Hitler's most prominently. Hitler certainly deserves a lion's share of responsibility for what happened. He was the primary architect. Yes, the Jewish (and Gypsy) Holocaust was one of history's greatest crimes. Yet, it has plenty of competition for greatest crime, and Hitler had many, many accomplices, including Western Civilization, all of it. It would be nice to point out the great efforts that the Allies engaged in to limit the Jewish Holocaust, but there is virtually no effort to point to. Most effort was token, taken after the Allied governments were badgered into doing *something*, even after they knew full well what was happening.

The point of this historical narrative on anti-Semitism is to emphasize the broad historical trends that led to a maniac like Hitler deciding to eradicate the Jews, and the Christian world playing along, with varying levels of complicity. The Jews also have *some* responsibility for their fate. Their insular ways among a fanatical and intolerant Christian culture made them logical scapegoats when something went wrong, as with the Black Death. Many thousands of Jews were burned alive for "bringing" the Black Death to Europe. The Jewish Holocaust is the most extreme example of scapegoating the world has ever seen.

Hilberg's *Perpetrators, Victims, Bystanders* provides keen insights into how everybody had a hand in the Holocaust, to one degree or another. The rare "altruists" in the Holocaust, who risked much for no temporal gain to help the Jews, are the only people who could even *try* to avoid some responsibility. Yet few, if any, of them will point the finger at anyone, and all likely asked themselves everyday what more they could have done. The European nations that had relatively small populations of Jews were in that situation because they had historic hostility to the Jews. Places such as Poland and the Netherlands had large Jewish populations precisely because they welcomed Jews when nobody else in Europe did. Denmark can hold its head high for saving its Jews in World War II, as can Finland, but centuries of Lutheran-inspired persecution of the Jews is primarily why those nations had such small Jewish populations in 1939. The militarism of those nations over the centuries also contributed to the mentality that made events like the Final Solution possible. They all had a hand in the Jewish Holocaust, to one degree or another. Making Hitler the fiend who was responsible for it all might seem comforting, but it deflects responsibility, and helps people avoid the introspection that asks, "What could I have done? What can I do today?"

The point I am trying to make is not feeling guilty and worthless about it, but asking ourselves how we contribute to our world in every waking moment, and how we effect the world for good or ill with our every action. Should not the study of history be about learning from the past, so we are inspired by the noble actions of our ancestors, educated by the less than noble, so we can avoid the pitfalls that our ancestors stumbled into, and aspire to attain or exceed their loftiest moments? Histories that make fake heroes, scapegoats and invisible victims do not seem useful, and even worse, can give us a false sense of how the world has worked.

Understanding the actions of our ancestors and the tapestry of dynamics behind them is very different from *justifying* them, or *condemning* them.

Other "Myth Debunking" Concerning the Holocaust

There is a booklet titled *The Facts - and the Myths - about the Holocaust*. It was banned in Germany, and is published by Andrew Carter. I got my copy through *The Spotlight*, a far right publication that is called neonazi. I subscribed to *The Spotlight* for years, and it is obsessed with Israel. Carter's pamphlet summarizes the main lines of argument that the Jewish Holocaust deniers have taken. Holocaust denier scholarship is some curious scholarship indeed.

A classic piece of Holocaust denier literature is Richard Harwood's (not his real name) *Did Six Million Really Die?* It is easily found on the Internet today. Harwood began his work with an unfortunate fact: wartime propaganda by the Allies against the Germans in World War I, with tales of Germans gleefully killing babies, smells like the story of the Jewish Holocaust. The truth is always the first casualty of any war, and all governments lie to their subjects in time of war. People need to be fed lies to justify murdering others. Beginning with that fact, Harwood made his case. He equated nationalism with Nazism, which in a sense it was, which says something about nationalism (Pol Pot was a nationalist more than a communist). Harwood discussed how Britain and America are threatened by "alien races in their midst." White people in America, like me, are among the "alien races" in America. To argue that white America is threatened with "alien races" in its midst is virulently racist. That is the kind of false argument that the Aryan Nation and other far right groups engage in. Harwood also mentioned the Jewish attempts over the millennia to keep their race pure, which is also true. Jews have been racist in that respect. Score another point for Harwood. The problem is, however, that a spoonful of truth helps the BS go down, as with all disinformation. Harwood began making his case that six million Jews did not die in the Jewish Holocaust, that it was a fiction that the Jews have used to further their aims, such as establishing Israel and wresting huge reparations from Germany.

Harwood then discussed the Nazi policy of getting Jews to emigrate from the Reich. That is also true. Harwood discussed issues that other historians have made, and it is hard to argue with his point of pre-war Nazi policy toward the Jews, such as the plan to ship the Jews to Madagascar. Harwood then discussed America's internment of Japanese-Americans during World War II, and how the Nazis were still trying to expel Jews well into the war, which was also true. Harwood's used facts to make his case, but they were selectively presented. European anti-Semitism received only passing mention in Harwood's presentation, which was the fatal flaw in his arguments. Harwood was grinding an ax. In his next section, titled, "Population and Emigration," Harwood's arguments took a steep slide into the bizarre.

Being a CPA and corporate controller, I am a specialist in the creation and presentation of

statistical data, and have done it for a living for many years. Data alone fails to impress, as it often needs to be dug into, to see how it was generated, how it is presented, what is being left out, what it does not measure, etc. Analyzing the statistical games that [William Rubinstein](#), [Julian Simon](#), [Elizabeth Whelan](#), [Steven Milloy](#) and other establishment apologists have played has been educational. Much is deeply flawed, if not dishonest. Yet, the presentations can be subtle in their deception, and some statistical sleights of hand better done than others.

Harwood's calculation of the Jewish population subject to Nazi control is about the shoddiest statistical manipulation I have ever seen, reminiscent of watching somebody play the shell game with his "customers." Harwood took one number from one source, subtracted numbers from other sources, and developed a highly creative arithmetic, arriving at a number of only three million Jews under Nazi control during the Final Solution, and made the case that there were not even six million Jews that *could* have been annihilated by the Nazis. There are numerous sources of information on the Jewish populations in Europe during the Jewish Holocaust and how many died. Accurate numbers are difficult to perfectly adduce given the circumstances, but Harwood made millions of Jews vanish with his arithmetic gamesmanship. Responsible scholarship puts the number of Jews subject to the Final Solution at around ten million. Nazi documents show that they had planned to deport nearly six million Jews in late 1940.[\[153\]](#) Comparing Harwood's methodology with the responsible scholarship on the issue can be informative.[\[154\]](#)

Harwood continued his analyses, and again used facts to make his case, such as the fact that no signed orders for the Final Solution can be gathered from the historical record. It is another creative rendition of the facts. Yes, there is no written order from Hitler that has survived, ordering the liquidation of Jews. Does that mean there was no "Final Solution," or that they were playing the plausible deniability game, which all politicians know how to play, especially for something as damning as exterminating an entire ethnic group? Harwood's arguments become increasingly weak, and his numbers games move his work into the category that Ward Churchill calls "tripe."[\[155\]](#) With all the other Holocaust denial (or as they prefer calling themselves, "Revisionists") literature I have seen, the trends are the same.

What most Holocaust deniers do is take events out of context, greatly exaggerate them or minimize them, depending on their rhetorical need, or misrepresent the evidence to make their claims. This essay will not take the reader down the long sordid trail of their "evidence" and how they play their game, but will summarize their main lines of attack, and give some examples of their craft.

One common charge by the Holocaust deniers is that the accounts of concentration camp survivors are uniformly unreliable, an angle that is particularly insulting to the survivors. The "skeptical" movement uses a nearly identical tactic to deny that [UFO contactees](#) had legitimate experiences and other "paranormal" activity. [Mr. Skeptic](#), who I debated for months on the Internet, was expert on that angle. In his theorizing, everybody associated with Dennis had

faulty memory, or was deluded about what was really happening. With that line of reasoning, he was able to boldly state that Dennis' perception of persecution was a "delusion." All we *know* are our human experiences. What goes on between our ears is all we truly know. Many thousands of people have testified to the death camp conditions, from guards who worked there, to residents who lived near the camps, to camp survivors, to camp visitors, etc. There also a mountain of physical and documentary evidence to support the testimonies. Some camp testimony is fabricated and some is inflated, but that does not mean the entire phenomenon is a mass delusion.[\[156\]](#) It is amazing that somebody would concoct a body of reasoning to dismiss it all in one way or another, yet that is a primary line of reasoning used by Holocaust deniers.[\[157\]](#)

Another fact the Holocaust deniers use is citing that Zyklon B was used to delouse inmate clothes. That was true, but they then try making the case that delousing was all it was used for.

Andrew Carter's *The Facts - and the Myths - about the Holocaust*, summarizes the lines of evidence and argumentation that the Holocaust deniers use. Carter also played the numbers game on the Jewish population and death toll, called Anne Frank's diary a fake, mentioned Red Cross relief at the camps, called Auschwitz a resort and rest home for sick Jews, stated there is no proof of gassings, cited unreliable survivor memories, how nice the Theresienstadt ghetto was, and other "facts."

Theresienstadt was the Nazis' "showcase" ghetto. It was the best camp in the Nazi regime, where "privileged" Jews were sent. Not all camps were the same. Some were work camps, some outright extermination camps, and Theresienstadt was the great exception. Yet, Carter tried making that case that if the Jews had it "good" at Theresienstadt, then there was no Final Solution. What the Theresienstadt case proves is that the Final Solution was complex in its envisioning and execution, and no mass event is monolithic. That impression is richly received by digging into the Holocaust literature. Carter, however, used the anomaly of Theresienstadt to try making the case that there was no Final Solution of extermination.

One pertinent aspect of Holocaust denial scholarship casts a harsh light on the far right. By definition, the Final Solution was a conspiracy. It is about the biggest conspiracy of all time. The Nazis killed several million people in secret, but not all that secret. Plenty of word got out about it, but few believed it and few really cared that much. One reason it was not believed at first was because the British lied so badly about the Germans in World War I, manufacturing atrocities out of the thin air. The stories were treated by many as the tale of the boy who cried wolf too many times, which was one more way that the British contributed to the Jewish Holocaust.

Nevertheless, when the word got out, it was acted on by very few people, and met a general wall of apathy, as there was a war to fight. The Jews were not alone in their secret suffering.

The millions of Russian POWs who died in German captivity also generally died out of sight of the Western media. After all, they were the hated communists. The Gypsies died unmourned, as did the Slavs of Eastern Europe. The Germans kept it quiet, and the Western press did not dig too far, aided by Western diplomats actively keeping it quiet. Even so, the Nazi Holocaust is one of the better-documented conspiracies of all time. Not only were numerous documents captured to plot the trajectory and execution of the Final Solution, but thousands of survivors testified about the concentration and death camps, including American soldiers. Also, many who were involved in one way or another in the Final Solution testified, and far more than just the Nazis who were tried in war crimes trials. Spectacular physical evidence of the Nazi Holocaust survived, such as the camps themselves, piles of clothing, hair and teeth taken from the victims. The Nazi Holocaust is perhaps the most undeniable conspiracy there is.

Right wing activists are the ones who most often specialize in conspiracy theories, sometimes concocting them with the flimsiest evidence. On one hand, they theorize about vast [international banking conspiracies](#), even though there exists virtually no documentary evidence or witnesses. The international banking conspiracy *does exist* to a degree, but there is hardly any overt evidence of it. The problem with [conspiracy theories](#) is that they *are* conspiracy theories. Conspiracies, by their very nature, do not leave paper trails, and they are generally uncovered by circumstantial evidence, which is a shaky way to determine anything. Weighing conspiratorial evidence is one of the most difficult investigations to perform, because there is little open evidence and numerous ways to interpret it. Many conspiracy theories may not be true, but many are quite plausible. Conspiracy theorists are often laughed at and derided. Their theories are often assailed and debunked, many times for good reason, but also many times for poor reasons. In my experience, those who debunk conspiracy theories are usually defending the establishment.

Conspiracy theorists usually hail from the right end of the political spectrum, and their scholarship is often poor. Some of it is acceptable, but more poor scholarship comes from the right wing than anywhere else, partly because right wing politics are too frequently the politics of the paranoid and deluded, which also manifests in racism and bigotry all too often, with a penchant for violence. Right wing scholars often propose conspiracy theories constructed from little solid evidence, and have their theories analyzed and debunked by many. The very same crowd that proposes conspiracy theories on the most tenuous evidence, debunk the Nazi Holocaust conspiracy, which has a vast amount of evidence for it. That is because Holocaust deniers apparently have an agenda, which is:

- Anti-Semitism;
- Rehabilitating Fascism and Hitler, and justify racist attitudes; If Hitler was not such a bad guy, then Fascism is not either;
- Paranoia about Jews, Israel and how the world is out to get them.

Yes, there probably are international conspiracies, and some of them center on Israel, but Zionists do not rule the world. Jews do not solely run the [banking conspiracies](#). Some Jews are probably part of it, but as far as I have seen, the high end of the game is not based on Jewish heritage but other factors, such as greed, which is far from a Jewish monopoly. There is Jewish organized crime, it is highly sophisticated, and I think [Gary Wean](#) stumbled into some of it, partly because California was a place that Jews migrated to in great numbers early in the 20th century, as they sought one more refuge from anti-Semitism. Today's Arab hatred of Israel and the United States is understandable. The *Protocols of Zion* are almost certainly fake, made in France in conjunction with the Russian secret police. Anne Frank's diary is almost certainly genuine, especially in light of the recent discovery that Anne's father removed some pages from her diary that frankly spoke about her parents' marriage. There are many accounts like Anne Frank's. To believe that her diary is part of the Jewish conspiracy is pretty far out.

A fair amount of right wing theorizing and scholarship is probably dishonest, while many have honestly fallen for it. I have borne some of the brunt of some [pretty huge conspiracies](#), and know that wide-ranging conspiracies *do exist*, but the international Jewish conspiracy is one that the crazed Adolf Hitler fell for, and it led to the deaths of about six million Jews. Using the same standard that Holocaust deniers have applied to the Final Solution, no conspiracy theory holds up.

However, the Holocaust denier ideologies are no worse than what pervades the mainstream media. Collectively, much bigger lies than denying the Jewish Holocaust happened are believed by the mainstream, such as there was no [American Holocaust](#) (Native American and internationally, such as [Central America](#), [Indonesia](#), [East Timor](#), [Southeast Asia](#), etc.), that [fluoride is good for teeth](#), that [attack the tumor works](#), that America exports freedom and democracy, that our system "works," and that America "[restored democracy](#)" in Panama and tried to "[save](#)" [Vietnam](#).

Holocaust scholars themselves have given the denier's grist for their mill at times, as there is plenty of dishonest and biased scholarship in the Holocaust scholar ranks, which brings this essay to its next topic.

A Different Kind of Holocaust Denial

Two primary works that "debunk" the work of the Holocaust deniers are *Denying the Holocaust* by Deborah Lipstadt and *Holocaust Denial* by Kenneth Stern. Lipstadt and Stern wrote works

to specifically take on the Holocaust deniers. In *Denying the Holocaust*, Lipstadt does a creditable job of deflating the arguments that Holocaust deniers use. She capably tackled the Holocaust denier arguments that there were no gas chambers, that there was no "Final Solution" of extermination, that Anne Frank's diary is a forgery, and she exposes the fascist/ racist agenda of Holocaust deniers. She probably should have stopped there, as she descended into making the case that the Jewish Holocaust was history's unique crime.[\[158\]](#) She has good company. Elie Wiesel is considered the first to make the "exclusivist" argument for the Jewish Holocaust.

The [Black Legend](#) of the Spanish legacy in the New World was black indeed. Its European rivals also used the Black Legend for propaganda purposes. Spain's rivals in the global colonial sweepstakes were every bit as genocidal in attitude as the Spaniards, and were even sometimes worse, such as the [English](#), who considered the natives subhuman, taking it a bit further than the Spanish did. The Spanish considered the natives inferior human beings, and thus justified their great crimes. The fact that Spain's rivals used its crimes against humanity for propaganda purposes did not make Spain's crimes any less. Spain was the first on the scene and plundered "virgin" grounds before its rivals joined the fray. The [Inquisition also became a political football](#) during the Protestant Reformation.

Because people exploit events for political ends does not make them less true. One area where the Holocaust deniers have made a strong case is in the area of Jewish exploitation of the Holocaust for political ends. Norman Finkelstein's recent book is a step in the direction of serious scholarship tackling the subject.[\[159\]](#) The fact that many Holocaust scholars have abused the notion of the Holocaust's exclusivity does not make the Holocaust any less horrible or evil. Lipstadt is far from alone among Holocaust scholars in making the case for the unparalleled evil of the Jewish Holocaust. What that crowd has done, and it even takes in some of the most respected Holocaust historians such as Lucy Dawidowicz, is minimize the suffering of other groups subject to genocidal policies.

For instance, the Jewish Diaspora endured nearly 2000 years of forced migrations at the hands of Christendom and the West. The Jews have not had a pleasant journey. While Holocaust scholars (almost all Jewish) go into great depth about the genocidal policies of the Nazis toward the Jews, quite often they minimize or ignore the suffering of Gypsies and Slavs at the hands of the same butchers. While the Jews were kicked out of everyplace in Europe at one time or another, the Gypsies were truly nomadic, whose philosophy was never staying in one place for long. The Gypsies probably originally came from India, displaced due to the Islamic invasions of India many centuries ago, and Gypsies were possibly low castes that fled the region, being at the bottom of the barrel when the Muslims invaded.

Gypsies have lived in Europe for several hundred years.[\[160\]](#) The "Jewish Question" was not the only ones the Nazis considered. There was also the "Gypsy Question." The solution crafted for the Gypsies was the same one the Nazis came up with for the Jews: extermination.

Probably at least a half million Gypsies died in the death camps, with another half million or more being killed by the Einsatzgruppen wherever they were found in the Nazi-controlled regions. Because Gypsies were nomadic, getting accurate numbers of pre-war populations and the death toll is more problematic than the Jewish death toll, but figures of a million or more are regularly estimated for the Gypsy Holocaust.[\[161\]](#) Even today, the estimates of the world's Gypsy population are guesses subject to wide variation.[\[162\]](#) While Lipstadt made her exclusivist arguments, the word "Gypsy" never even came up. Two-thirds of Europe's Jews perished in the Holocaust, and about half the European Gypsy population died at the same time. Hitler's genocidal policies killed far more Slavs than Jews and Gypsies combined. Perhaps more than fifteen million Slavs died due to a conscious extermination program by the Nazis to clear Eastern Europe to give the Germans "living space."[\[163\]](#) The Nazis targeted and murdered perhaps more than twenty-five million people, and up to six million of them were Jews. That does not minimize what the Jews endured, but for Jewish Holocaust scholars to constantly minimize or ignore the suffering of Gypsies and Slavs, among other targeted groups, such as Russian POWs, is grim.

Mainly because of Jewish influence in the United States, there is now a Holocaust museum in America, in Washington D.C. Gypsies are almost entirely absent from the museum's exhibits. In a telling event, Gypsies were specifically excluded from a candle ceremony to remember those who died at Auschwitz. In the British press (and not in the [American press](#), as usual) were photos of the candle ceremony and pictures of Gypsies "staring mournfully through a wire fence, with a caption reading, 'Cold-shouldered: Gypsies, whose ancestors were among Auschwitz victims, are forced to watch the ceremony from outside the compound.'"[\[164\]](#) Jews who have created deplorable scenes such as that are trying to corner the market on victimhood, playing up their suffering to the maximum, and denying the suffering of those who died right alongside them. Holocaust denial is Holocaust denial, and Jewish scholars have tarred themselves with the same brush they have painted the deniers of the Jewish Holocaust with, for tragic irony.[\[165\]](#) There is no Holocaust Museum for Native Americans. During the late 1990s, U.S. Secretary of State Madeleine Albright, a Jew (who recently discovered her hidden heritage), [justified the deaths of hundreds of thousands of Iraqi children](#), killed mainly by the U.S.-instigated economic embargo of Iraq, calling it a price we were willing to pay.

Many Jews tried cornering the market on the word "holocaust," as if they are the only ones in history to have suffered it. Jews are white people, and the situation around the holocausts of colored people is the single greatest body of Holocaust denial in the West. The [genocide of Native Americans](#) is the single greatest holocaust in history, a holocaust that has been so thoroughly denied for hundreds of years that it has only recently come into American awareness, a holocaust denial that continues with what America did to [Southeast Asia](#), and what America is doing to [Iraq](#) today. *There* is a holocaust denial far, far more egregious than anything that the lunatic Jewish Holocaust denier crowd has ever tried foisting on the public, mainly because "responsible" scholarship has actively abetted it, and the holocaust is still

happening.

William Blum begins his monumental *Killing Hope* with:

"In 1993, I came across the review of a book about people who deny that the Nazi Holocaust actually occurred. I wrote to the author, a university professor, telling her that her book made me wonder whether she knew that an American holocaust had taken place, and that the denial of it put the denial of the Nazi one to shame. So great and deep is the denial of the American holocaust, I said, that the deniers are not even aware that the claimers or their claim exist. Yet, a few million people have died in the American holocaust and many more millions have been condemned to lives of misery and torture as a result of U.S. interventions extending from China and Greece in the 1940s to Afghanistan and Iraq in the 1990s. I enclosed a listing of these interventions, which is of course the subject of the present book.

"In my letter I also offered to exchange a copy of the earlier edition of my book for a copy of hers, but she wrote back informing me that she was not in a position to do so. And that was all she said. She didn't ask to see my book. She made no comment whatsoever about the remainder of my letter - the part dealing with denying the American holocaust - not even to acknowledge that I had raised the matter. The irony of a scholar on the subject of denying the Nazi Holocaust engaging in such denial about the American holocaust was classic indeed. I was puzzled why the good professor had bothered to respond at all."[\[166\]](#)

When I read Blum's words in 1996, I suspected that he was writing about Lipstadt, and I wrote him, asking him if it was. He replied that indeed it was Lipstadt, and gave me permission to make that fact public, so I am.

What happened to [East Timor](#) during the 1970s may have had a proportionally greater genocide happen to its people than the Jewish Holocaust, in this past "enlightened" generation, a genocide that was actively sponsored and abetted by the United States and nearly every Western nation. The complicity in genocide by Lipstadt and others has helped ensure that the American Holocaust continues, as America kills off Iraqis today.

A better work on Jewish Holocaust deniers is Kenneth Stern's *Holocaust Denial*, which discusses the "hesitation" in the Jewish community to acknowledge other genocides because they believed that to do so would diminish what happened to the Jews.[\[167\]](#) To his credit, he mentioned Gypsies a couple of times in his book, and discussed how all holocausts need to be discussed and their nature understood. Stern wrote, "By focusing only on one's own tragedies, strategies, lessons, and power are lost." Yet, he also gave a questionable treatment to the

situation of Noam Chomsky and Robert Faurisson. Chomsky is a Jew who lived in an Israeli kibbutz for a short time. Faurisson is a Holocaust denier from France. Although [freedom of speech in America is problematic](#) and not nearly as free as our [mainstream media](#) presents to the public, it is less free in supposedly genteel nations such as Canada, France and Sweden, where Holocaust deniers have been put on trial and jailed for their writings.

When Faurisson was put on trial in France, hundreds of academics signed a petition to defend Faurisson's right to deny the Jewish Holocaust in his writings, even if they detested his views. It was an issue of freedom of speech. As Chomsky stated regarding the Faurisson affair, freedom of speech is not something that we grant only to views that we agree with. If we believe in freedom of speech, we grant it *especially* to those with views that we "despise." Otherwise, we do not believe in freedom of speech. Chomsky and hundreds of other academics were defending Faurisson's freedom of expression, even though they despised what he had to say. Chomsky received endless attacks for his stance. Chomsky wrote a brief essay on the nature of freedom of speech that Faurisson's publisher inserted as the introduction to Faurisson's book.

In Lipstadt's *Denying the Holocaust*, she called Chomsky's defense of Faurisson's right to free speech his "antics." In Stern's book, he published a decidedly one-sided account of the affair, and even relied on a secondary source to smear Chomsky to make him seem a [Holocaust denier of the Cambodian Holocaust](#), something that I have never seen in any of Chomsky's work.^[168] However, Stern also made the exclusivist argument in his book, pointing out that other genocides had economic or other incentives behind them, while carrying out the Jewish Holocaust hampered the Nazi war effort.^[169] Every holocaust is unique in its own way. What was uniquely worse, the Nazi genocide, which was ideologically motivated from a cultural hatred for Jews and other "subhumans," a genocide that exterminated two-thirds of European Jews and half the European Gypsies, or the [genocide of the Taino of the Greater Antilles](#), which was a mere *side effect* of the first gold rush in the New World, and the world's only *complete genocide* of millions of people? The complete genocide of the Taino has been so deeply denied in America that the genocide's initial architect has a national holiday in his name. How would Jews feel if there was a Hitler Day in Germany, which celebrated the invasion of Poland?

The words "never again," should apply to all peoples, for all time.

The Last "Good War" Revisited

World War II is described in the United States as its last "good war." The reason for the "good war" description is that America's wars since then have been more problematic, with the

delineation of good and evil clear in World War II, and rather muddled since then, contrary to the recent rhetoric of [George Bush the Second](#). In World War II, America was the white knight on a steed, saving the world from the evil of Hitler and his henchmen.

Our leaders were not too disturbed by the [rise of Hitler](#), nor was the [public enamored with Jews](#). FDR was not too high on Hitler, and is considered the West's only leader who smelled Hitler's fumes early on, and was opposed to his rule. That is true, but relative. Stalin was little better than Hitler, and in some ways worse, and FDR took part in remaking Stalin into "Uncle Joe" while there were Nazis to defeat. Stalin was *Time*'s "Man of the Year" in 1943. George Orwell [could not find a publisher for his *Animal Farm*](#) because it was a satire on Britain's ally of the moment.

The hypocrisy related to the U.S. position toward the Soviet Union is enough to make the "good war" sentiments collapse. Long before Hitler became a threat to the world, Stalin's hands were bloody with the deaths of millions of Soviet peasants, where the official policy was starving them to death. The Western governments were wary of those communists and everything they stood for, until they became handy allies to defeat the Nazis after Hitler double-crossed Stalin and invaded the Soviet Union, after they divvied up Poland and Eastern Europe. Then one of history's greatest butchers became "Uncle Joe," with the American press sanitizing his image. It was a remarkable makeover, from butcher to buddy.[\[170\]](#) Churchill and Roosevelt actively covered up the 1940 Katyn Massacre, which Stalin ordered.

The shifting alliances of those times, among all imperial parties, clearly demonstrates that issues of right and wrong had little meaning to anybody, but winning was everything. Almost anybody would side with anybody, if it meant winning. The Soviet Union was in the middle of many of those diplomatic machinations, from alliances with Germany, Italy, Japan and the Allies, to declarations of war. The Soviets hoped the Germans and British would wipe each other out in the Battle of Britain, just as the British and Americans hoped the Soviets and Germans would wipe each other out during the invasion of the Soviet Union. The Germans and Soviets hoped the Japanese invasion of Eastern Asia and the Pacific would preoccupy America. The Soviet Union eventually declared war on its erstwhile ally Japan, and the United States atom bombed Japan to end the war quickly to prevent the Soviets from controlling too much of Eastern Asia. The U.S. used Japanese troops immediately after the war to try putting down the Chinese Communist Revolution, and Japanese troops were also immediately put to work to try recolonizing Vietnam, even though Ho Chi Minh was an U.S. ally against Japan during World War II, and was the overwhelming favorite of the populace to lead Vietnam to independence. Butcher as buddy, buddy as butcher, allies thrown to the wolves, nations playing off one against the other, etc. The last "good war." After Michael Adams finished briefly summarizing the imperial dynamics between the major players of World War II, in the years that led to the war, he wrote, "Looking back, we might say that the history of the period does not reflect particularly well on any of the major players."[\[171\]](#) For the vast majority of humanity, living under the boots of those major players, it was an obvious sentiment.

America stayed "neutral" throughout the war's first two years, except for providing aid to Britain, closing off the Panama Canal to Japan and other sanctions against them, with Standard Oil, Ford, General Motors, du Pont and others helping build the German war machine.

There is substantial evidence that FDR and the military brass had pre-knowledge of the Japanese bombing of Pearl Harbor, and the troops in Hawaii were not warned, as a bloody attack would be needed to spur the isolationist American people into another foreign war, similar to how Americans were [manipulated into entering World War I](#). The Pearl Harbor attack was certainly no surprise, as in early 1941 Secretary of War Henry Stimson received a memo from Rear Admiral Richmond Kelly Turner that warned of an attack on Pearl Harbor. That memo was merely part of a chorus of warnings and studies from the military brass in those days.[\[172\]](#) Those boys at Pearl Harbor may have been expendable.

War is evil business, and always has been. Violence is *always* a violation of another's free will. Warfare extracts a great psychological, emotional and spiritual price from all of its participants. There is no glory in it, and a comprehensive and sophisticated system [manipulates young men into becoming soldiers](#).

Intense indoctrination accompanies the evolution of all imperial soldiers, whether they are American, Japanese, Chinese, Russian, European, etc. During World War II are many instances of the psychological resistance of young men to the horrific barbarities that they inflicted upon the "enemy," whether it was Jewish children, Chinese women, Japanese civilians, Gypsies, Slavs, and so on.

Before World War II began, the Japanese were bludgeoning Eastern Asia and periphery. As with Jews and Spaniards around 1492, if one took a Japanese and Chinese citizen, stripped and physically examined them, one could not be discerned from the other. Japanese are physically nearly indistinguishable from Chinese, and their culture originated in Chinese culture. Japan, like China, had a long-standing imperial culture, although both were rather insular for centuries. China resisted Europe's imperialism for centuries before succumbing to British ambition in the Opium Wars and subsequent events. Japan did not succumb to the West until two atomic bombs were dropped on them. Japanese indoctrination viewed China as a great adversary, not unlike European indoctrination of their people to hate their neighbors, where Frenchmen killed Englishmen, etc. for centuries.

Japan invaded China several years before World War II, with their invasion of Manchuria happening in 1931. In 1937, the Japanese invaded China and took the capital city of Nanking. Their initial occupation of Nanking is now known as the Rape of Nanking. Ever since Japan received their wake up call in 1853, by a massive show of U.S. force led by Commander Matthew Perry's "diplomacy," they nurtured their imperial ambition, wanting to become imperial

powers like the U.S., Britain, France and Russia. They stated that they only wanted to control Southeast Asia as the United States controlled Latin America, a reasonable request in Japanese eyes. The U.S. and the other European powers [had already divvied up Eastern Asia](#), and were not about to let a local imperial presence take over. After all, China was theirs; the [Philippines](#) were ours.

The Japanese developed a strident imperial nationalism, building on their "Bushido" ethic, which made possible the Kamikazes and other fanatical soldiers. Some Japanese theologians believed that their emperor outranked the Creator. When the Japanese took Nanking, they slaughtered the Chinese men and raped the Chinese women. The Japanese had a tradition of swordplay, and decapitating Chinese men was the pastime of Japanese soldiers during the Rape of Nanking. Japanese newspapers recorded the "contest" of two Japanese officers, Mukai Toshiaki and Noda Takeshi. They vied to see who could kill one hundred men first with their swords. The contest was extended when both exceeded their mark, with Mukai at 106 and Noda at 105. The "finish line" was extended to 150. Their "heroic" acts were often enacted on kneeling Chinese men, waiting for the blade to do its work. Decapitating a Chinese man became quite the art form among Japanese soldiers. The goal was taking the head off cleanly with one artful stroke, with the resultant spout of blood shooting in a majestic arc from the severed carotid artery supplying the head. Japanese soldiers used Chinese men for bayonet practice, with Chinese men being tied up on wooden crosses, like scarecrows, to be run through repeatedly by Japanese soldiers in training.[\[173\]](#) Satanic violence was not a European monopoly.

How could Japanese soldiers enact such evils against people who were virtually indistinguishable from themselves? In the same way the Englishman was indoctrinated against a Frenchman, the same way a Nazi was indoctrinated against a Jew, the same way an American was indoctrinated against Japanese, German, Vietnamese and Native American citizens, etc. We all have two arms, two legs, were born from our mothers, went to school, raised our crops, etc. Even with all their intense indoctrination, the "virginal" Japanese soldiers, when faced with slaughtering kneeling Chinese, men, women and children, had to be cajoled and forced into their first kills. They had to be reminded that they were "only" killing the "subhuman" Chinese, as if they were "only" killing dogs. One Japanese soldier spoke of how his mass-murdering comrades looked like predatory animals, when looking into their eyes. After getting into the swing of things, his buddies no longer looked so feral.[\[174\]](#)

The atrocities of the Japanese against China in the 1930s and 1940s is one of the history's greatest mass murders, with more than ten million Chinese citizens dying at the hands of their Japanese overlords.

One of my grandfathers [served in the Pacific Theater](#), and as with most soldiers who survive such calamities, he was not an eager fireside raconteur of his glory days. He preferred to forget them, although he kept in touch with his war buddies until they all died off, and I visited

two of them in my youth. His sober recollections of his comrades' skull collecting and other practices are not out of step with those days.

The curator of the Smithsonian's Division of Anthropology announced that the Japanese skull was 2000 years less developed than the Americans' were, and because Japanese eyes were "slanted," they could not shoot straight. During the fighting in the Pacific, one correspondent reported in the pages of *Atlantic Monthly*:

"We shot prisoners in cold blood, wiped out hospitals, strafed lifeboats, killed or mistreated enemy civilians, finished off the enemy wounded, tossed the dying into a hole with the dead, and in the Pacific boiled the flesh off enemy skulls to make ornaments for sweethearts, or carved their bones into letter openers."[\[175\]](#)

In *Life* magazine in 1944, an attractive blond American woman posed with a Japanese skull that her fiancé sent her.[\[176\]](#) When American homesteaders washed across the plains of North America, occupying newly stolen land, there was often more money to be made in plowing their homesteads to find Indian bones than in raising crops. Indian skulls brought up to \$1.25 in Dodge City, and arm and leg bones, "properly cleaned and polished, made knife handles, 'beautiful to behold.'"[\[177\]](#)

Two of the world's most prominent war scholars, Paul Fussell and John Keegan, consider the memoirs of Eugene B. Sledge one of the greatest first-person accounts of warfare ever written.[\[178\]](#) This war essay would not be complete if it did not recount some of war's stark realities, realities that the American press carefully hid from the American public. Sledge's tale will serve that purpose well. Readers who do not want to read about such matters can skip this section and resume reading by [taking this link](#).

Unpretentiousness is one of Sledge's greatest virtues as he tells the story of being a U.S. Marine at two of the fiercest battles ever fought. He was an average American boy, growing up during the Great Depression. He enlisted in the Marines in 1942 as "cannon fodder," forsaking the deferment and officer-rank safety that was offered him as a member of the Marion Military Institute.

Early in his account, Sledge commented on a primary aspect of the Pacific war between the Japanese and American soldiers. There was an unrelenting hatred between the two. Sledge cited the fate of the Goettge patrol during the Battle of Guadalcanal, as he watched one of the survivors walk past. During the first week of the battle, a captured Japanese soldier claimed

that his starving comrades near a distant river would surrender if the Marines would "liberate" them. Twenty-five men, none of them fighters, but a linguist, a surgeon and intelligence specialists went to "rescue" those stranded Japanese. The Japanese had, like Europeans of long ago, discarded the idea of fighting honorably. The Japanese ambushed the Goettge patrol as it landed, and only three Marines escaped. That was part of the Marine lore, and fueled their anti-Japanese hatred.[\[179\]](#)

Sledge's account depicts the typical lives of U.S. infantrymen, and his first taste of battle was when he stormed ashore at Peleliu. He prayed a lot. His chapter recounting his first days of battle is appropriately titled, "Assault into Hell." The hail of fire from both sides was devastating. Sledge described the absolute helplessness he felt while being subject to such a barrage, watching Marines being blown to bits. During the initial landing, Sledge watched as one of his friends, a non-commissioned officer (NCO), was hustled to the rear with a bloodied arm in a field dressing. Sledge yelled, "Hit bad?" The NCO grinned and said, "Don't feel sorry for me. I got the million dollar wound. It's all over for me."[\[180\]](#) The NCO got the wound coveted by most American soldiers: a wound bad enough to spell the end of their days as a soldier, but not bad enough to permanently cripple them. They could "retire" with honor, and live to tell about it.

During the landing, Sledge saw a Japanese corpsman's corpse, killed while trying to give aid, by an American shell. The innards of the Japanese dead shocked Sledge, and his buddies arrived and began fieldstripping the corpses. Sledge watched mutely as his buddies worked over the corpses. One Marine "deftly plucked a pair of hornrimmed glasses as casually as a guest plucking hors d'oeuvre from a tray at a cocktail party."[\[181\]](#) Sledge wondered if the day would ever come when he would become so nonchalant about stripping enemy corpses. Sledge noticed that when he tried smiling, his face felt "stretched tight as a drumhead." Genuine smiling was impossible. He noticed that the faces of those around him were similar. The carnage of that first day of battle was one of the worst that any U.S. Marine ever experienced. Sledge watched men being turned into hamburger all around him. On that first night, as Sledge was becoming familiar with the numbness and terror that would be his companion in the coming months, he heard a voice shout, "You will survive the war!" Sledge looked around and asked his buddies if they heard that statement, and they looked quizzically at him. Sledge believes that God spoke to him that night, and he resolved to make something of his life after the war.[\[182\]](#)

Early in the Peleliu campaign, Sledge came to perhaps the salient realization of all his days as a soldier. After digging in for the night while they were moving across Peleliu, in the dark of night an uncomfortable notion appeared in Sledge's mind: he was expendable.[\[183\]](#)

One night soon after, while they inhabited their foxholes, one Marine went mad, and began yelling that the Japs had him. After efforts were made to quiet him, the Marines had to kill one of their own to keep him silent. Sledge watched one of his own kill a buddy in the dark,

executing him with a shot to the temple, as they mistook him for a Japanese infiltrator. Sledge was nearly killed by "friendly fire" during his first day of battle. Sledge repeatedly stressed the vast gulf between himself and those mere miles behind the front, even mere yards behind at times. Those on the front lines and those just behind it lived in different worlds, the support troops unable to fathom the world that the front lines inhabited. The same night, a Japanese infiltrator snuck into the lines. When he ended up in a foxhole with a Marine, they both lost their weapons, and the Marine won when he put his finger through the Japanese soldier's eye socket, killing him during their unearthly screaming.[\[184\]](#)

A few days after securing the beachhead of Peleliu, Sledge was fieldstripping corpses himself when a Marine decided to obtain the gold fillings in the mouth of a fallen Japanese soldier. He put his kabar knife to the golden tooth of the Japanese soldier and drove the point home. It missed, partly because the owner of that coveted tooth was still alive. The blade struck deeply in the Japanese soldier's mouth, and the Marine cussed out the Japanese soldier while he sliced the man's mouth from ear to ear. He put his boot to the man's mouth and tried again, as blood poured out of the soldier's mouth. Sledge had already seen a Japanese soldier's reaction as he killed him, but as that Japanese soldier began gurgling, Sledge shouted, "Put the man out of his misery." Then another Marine ran up and planted a bullet in the Japanese soldier's brain. Sledge saw his pals quickly slip into almost unimaginable barbarity.[\[185\]](#)

While taking a break in the fighting, Sledge rested next to a Japanese machine gun squad that had been killed. The gunner looked poised to fire his weapon...except the top of his head had been blown off by American fire. While they sat there resting, one of his buddies had a handful of coral pebbles in his hand, and was pitching them toward the opened skull of the Japanese machine gunner. Every "hit" was accompanied by a small splash as the pebble found its mark in the gunner's open skull. The soldier was not being malicious, but just playing as a child might, doing something to pass the time.

Sledge was then saved from his own descent into barbarity, as he began taking gold teeth from Japanese mouths. A medic saved him, appearing on the scene when Sledge was about to make his extractions. He discouraged Sledge by disingenuously telling him that he could get disease from the Japanese mouths.[\[186\]](#)

The Battle of Peleliu, of dubious strategic importance for the U.S. Pacific effort, was until that time one of most vicious battles that U.S. forces had ever engaged in. At the end of the battles, one of Sledge's buddies showed Sledge his prized souvenir, a Japanese hand he liberated from a soldier's corpse. He had been carefully trying to dry it out so it would not stink. After a razzing by Sledge and his fellow Marines, and defiantly defending his right to the souvenir ("How many Marines you think that hand pulled the trigger on?"), the Marine reluctantly threw his prize away.[\[187\]](#)

The Japanese did worse things to American bodies. One day Sledge passed three dead

Marines lying on stretchers that the Japanese had come upon. Sledge's buddy groaned, "Jesus!" and Sledge looked on in disbelief. The Japanese had decapitated one Marine and placed his head on his body, next to his severed hands, and his penis had been cut off and placed in his mouth. The Marine next to him was treated similarly, and the third had been butchered like a steer. After they returned to their gun pit, his buddy said, "Did you see what them poor guys had in their mouths? Christ, I hate them slant-eyed bastards!" Sledge stated that from that point onward, he never had any pity for the Japanese soldiers, no matter what happened to them[188]

The horror of Peleliu made hardened veterans recoil. In one incident, a camouflaged Japanese artillery gun hid until the Marines were right on top of it, then it let loose at point blank range. One veteran who Sledge previously saw laughing and cursing at the Japanese while under heavy fire was stricken, the most devastated that Sledge saw him before or since. The tough soldier told Sledge how he and another soldier tried carrying a buddy they all knew to a stretcher in the aftermath of the gun's firing, but as they carried him, the man's body fell apart.[189]

Sledge began losing his sanity at that time, the battle taking its inexorable toll. He received a pep talk from his lieutenant, and was somehow able to stay sane for the next two weeks. The only escape was death or wounding, and despair settled over the soldiers. The only cheerful soldiers were those leaving with the [million-dollar wound](#). The Marines never left a wounded soldier in the field, because the Japanese would invariably torture him to death.

Sometimes, nearly as despised as the Japanese were the souvenir hunters from the rear echelon, who were not veterans of the grisly front lines, but opportunists who followed the advancing line, searching for souvenirs among the dead Japanese. One Marine major commandeered any souvenir hunters he found in his area, putting them into his line if they came into his area. One day during a lull in the fighting, two souvenir hunters from the rear walked past Sledge, walking into enemy territory. Just as Sledge was about to warn them where they were, one turned back and asked Sledge where the front line was, Sledge "serenely" answered, "You just passed through it." Those men quickly fled to the rear.

Right about that time, Sledge endured the greatest grief he experienced during the entire war, when his beloved captain was killed. All the soldiers looked up the captain, and news of his death hit all the men hard. It was as if they had lost a parent.

The tableau of Peleliu was like no other on earth. War had seen fields strewn with dismembered corpses, but Peleliu was in a class by itself, with coral ridges, rubble-filled canyons, corpses strewn everywhere, with crabs and flies gorging on the dead to the degree that they could barely move. Low clouds scudded by during the dismal daytime and the hellish landscape was lit at night by flares. Sledge thought it looked like another planet.[190] The smell of excrement was mingled with the stench of death, as the coral was not amenable to

digging a latrine hole. In addition, many soldiers had dysentery. The island became a huge cesspool of death and decay. Sledge wondered if he would ever remove the stench from his lungs. DDT was used for the first time ever at Peleliu, in an attempt to reduce the fly population. It did not work, as far as Sledge could see.

Sledge and his buddy took over a mortar pit when replacing another mortar crew. The Marine he replaced did not appear happy that he was being relieved. He warned Sledge what had happened the night before. Two Japanese soldiers snuck into the pit and began stabbing the mortarmen before nearby ammo carriers came to the rescue and killed them. One Marine had already died from the ordeal. The Marine left with a warning for Sledge and his buddy to watch out at night for Japanese soldiers sneaking into their pit. Sledge was long since used to the sight of blood, but as he began settling in, the bloodstains in the pit got to him. He tried covering up the Marine blood with scraps of cardboard. He reported that the flies stayed glued to the blood-smeared rock, and Sledge realized how empty was a politician's rhetoric about young men giving their lives for their countries, as "only the flies benefited."[\[191\]](#)

Each day was a new horizon in loathing, with each new macabre scene competing to outdo the others. Even the most hardened veteran found something to make him "recoil in horror and disbelief."[\[192\]](#)

The Marines lost more than half of its landing force on Peleliu, with more than 5000 casualties and more than a thousand dead. More than ten thousand Japanese soldiers died during the siege, and only *seven* Japanese soldiers were taken prisoner. It was a fight to the finish. The hatred that the Japanese and American soldiers held for each other made it so there were few prisoners taken by either side.

As Sledge got aboard ship after Peleliu had been subdued, he asked one of the old salt Marines what he thought of Peleliu. That old Marine had been in the trenches in World War I, and was looked up to by all the young Marines as the Marine's Marine, the epitome of the corps. Sledge had nothing to compare Peleliu with, so he asked the old salt what he thought. Sledge expected the Marine to respond with, "You think that was bad, you oughta been in the Old Corps." Instead, Sledge was surprised when the old timer blurted out, "Boy, that was terrible! I ain't never seen nothin' like it. I'm ready to go back to the States. I've had enough after that."[\[193\]](#)

Sledge's belief in basic human goodness died at Peleliu, and his faith in politicians who send young men off to war.[\[194\]](#) While recovering from Peleliu, Sledge experienced something that many American soldiers commented on, including my father. When they reached Pavuvu, their staging ground for Peleliu, a woman from the Red Cross, who was handing out grapefruit juice, greeted them. A number of Sledge's buddies sullenly tolerated her presence. Sledge and some other Marines took her up on her offer of grapefruit juice, but Sledge was bewildered, and he deeply resented her presence. It was no place for women or politicians to

be.[\[195\]](#)

Sledge is proud to have been a Marine. He did not speak out against the necessity of war. He just told is like it was, from a grunt's-eye perspective. Sledge was interviewed for candidacy for an officer position, but he was too frank with the interviewer. He did not "snow" him. In responding to the question "How do you feel about it now that you've been in combat?," Sledge candidly remarked that he has seen enough on Peleliu to satisfy his curiosity about fighting. Sledge said, "I'm ready to go home."[\[196\]](#) He would not, quite yet.

While preparing for the siege of Okinawa, Sledge heard with sympathy the reports coming back from the terrible fighting on Iwo Jima, another fierce battle with tremendous casualties. Sledge got hepatitis while at Pavuvu. In peacetime, hepatitis is a big deal, warranting hospitalization, but in wartime, Sledge was given some pills and was only able to get out of several days of work details, such as picking up trash. They all got a round of painful inoculations before departing for Okinawa, making them grouchy.

For all the sufferings of Peleliu, Okinawa made Peleliu seem like a picnic. Okinawa was part of the Japanese archipelago, and the Japanese would fight as never before to defend it. More than 100,000 of Japan's finest soldiers were defending it.

While preparing for Okinawa, Sledge's crew got a new officer named Mac, from New England. Mac was the only officer Sledge ever heard who talked up taking on the Japanese. Mac told in detail about how he would whip the Japanese single-handedly when one of his men was wounded. The combat veterans rolled their eyes when he started in with his speeches. Sledge was embarrassed for him, and the other veterans looked forward to when the big-talking "Yankee" saw combat for the first time. Sledge trained on Guadalcanal for Okinawa, and he remarked on how generous the Seabees were with their food for the Marines, food that was much better than their Marine rations.

The Marines expected fierce resistance to the landing on Okinawa, of more than 80% Marine casualties on the first landing, but were amazed that there was practically no resistance. The first day they marched across the island unopposed. They knew it was too easy. They marched to the fighting soon enough, and Sledge was in heavy battle for fifty nearly solid days in some of the most horrific fighting the world has ever seen. Being a veteran, as he approached battle, Sledge no longer felt panic as he had in Peleliu, but knew that he could control his fear, and the only thing to do under Japanese shelling was lay low and curse them.
[\[197\]](#)

Sledge was blessed with a little humor at the battle's beginning, when they first came under fire. That braggart officer Mac made an amusing display. A couple of their men had been killed, and they finished digging in and were settling in when they noticed that Mac was still feverishly digging his hole. One of the soldiers then reminded Mac that he said he would

charge the Japanese single-handedly with his kabar knife when one of his men was hit. Mac barely looked up as he continued digging frantically. Sledge offered him his kabar knife so he could charge the Japanese. One soldier remarked that if Mac dug much deeper, he would dig all the way through the earth, back to the U.S., and they could all go home. Mac's cavern was ruined in minutes, to his men's satisfaction, and Mac never bragged about what he was going to do again.

Sledge was ashamed that Mac was a Marine officer. While marching across Okinawa, Mac alarmed the troops by shooting at something, and a detachment of Marines approached, thinking that there was a Japanese ambush. Corpses were strewn across the land. When they came upon the source of the gunshots, it turned out that Mac was shooting the skull of a dead animal, seeing if he could shoot any teeth out of the animal's jaw. Another time, Mac located a Japanese soldier's corpse, and carefully shot off the end of its penis. When it came time to urinate, most Marines found a nearby bush. Not Mac. He would find a Japanese corpse, and send his stream into its mouth. Sledge watched such behavior with shame for the Marine Corps, as did his buddies. He was an officer, however, so they did not slap him upside the head (or as my father once told me, Mac would become a quick casualty of some "accidental" friendly fire). Just before the real battle was engaged at Okinawa, Mac almost took out his mortar section himself by trying to empty a grenade of its charge then tossing it into a group of Marines, getting a sadistic delight as the Marines dove for cover. Mac failed to completely empty the grenade and almost took his men out of action before it began. If his "joke" had given Sledge his million-dollar wound, Sledge would have gladly taken it, in retrospect.

The Japanese spent six thousand lives in an early failed effort to cut off a detachment of Marines from the main force. During the fighting, news had come that the Germans had surrendered, but nobody on Okinawa cared much. Sledge wrote, "Nazi Germany might have well been on the moon." The casualties were mounting, with more than 1400 casualties in Sledge's Marine division so far. Then the fighting *really* got fierce. The warm up for the fierce fighting was Sledge getting to haul ammo through the mud, which he said surpassed all the drudgery he had ever done before.

Sledge found that each time he faced going into battle, it became harder to face, where death or maiming became a more certain fate with each passing hour. When he wrote his book many years later, Sledge still had nightmares about going up the lines on Okinawa, trudging through the mud.[\[198\]](#)

Although the Marines were the elite infantrymen of the U.S. Military, seeing the worst action, they did not all live up to those high standards of the Marine ideal, and Sledge wrote of his disgust from time to time with his comrades. He watched an officer called Shadow chew out a man for a heroic act of moving ammo under heavy fire to where it was needed. The men watched in disbelief as Shadow launched into his tirade against the man, who Sledge thought

deserved a medal for his act.

Sledge got a letter from home in a lull in the fighting. His parents wrote that his dog had been hit by a car and killed. That dog was Sledge's childhood companion, and as he read his letter in his foxhole, with death and destruction all around him, big tears rolled down his cheeks as he thought of his beloved dog.

He soon was thrown back into battle, and had a continuous headache from the barrage of artillery going back and forth, which sent him into a stupor.[\[199\]](#) Then Sledge got into the *really* heavy fighting. He was in the battle around what they called Sugar Loaf Hill. With all that Sledge had been through, his most horrifying experiences were still ahead of him. The Japanese dead laid everywhere in the mud. When they would dig in, they would try burying the dead Japanese soldiers in the mud to try cutting down the stench and flies. Then Sledge saw the sight that shocked the veterans in the ranks: dead Marines lay everywhere, slowly rotting away. The Marines had a tradition of going to great risk to recover their fallen. The reason those Marine bodies had not been recovered quickly became apparent. The fighting was so intense that recovering the bodies was impossible.

The next ten days were Sledge's personal visit to hell. The fighting on Peleliu was more vicious, but the fighting on Okinawa was more horrifying. After digging into the mud at Wana Draw in a constant deluge of rain and artillery fire, Sledge looked around. The craters made by shells surrounded him. Each of them was filled with water, and many held a Marine corpse, covered with swarms of flies. Maggots and discarded equipment lay everywhere, with an awesome stench that never went away. Amoebic dysentery broke out amongst the troops, and Sledge sat in his hole with his mortar, thinking that death was preferable to what he was experiencing. It was if he had been "flung into hell's own cesspool."[\[200\]](#)

To top it off, their commanding officer came down with malaria so badly that he had to be evacuated, and the hated Shadow became their commanding officer (CO). There came a moment during a lull where Sledge and a buddy were looking at picture of a dancing girl the buddy had an adulterous affair with Stateside. The scene was surreal, of two men in the bowels of hell, looking at a picture of a scantily clad, voluptuous woman. The scene struck Sledge hard, and he realized that he was beginning to lose his sanity. At that moment he made a fervent pledge to himself that no matter what happened, he would not lose his mind. His resolve got him through the days. At times during the nights, he felt that he was slipping, but he recovered in the daylight. In retrospect, Sledge realized how heroic yet hopeless was the battle for those Japanese soldiers. They would form skirmish lines and advance at the Marines from hundreds of yards away, to be blown to bits long before they got close enough to return fire. It was a "turkey shoot" for the Marines. They were nearly having fun for awhile.

Sledge related one episode where ten Japanese soldiers came at them in formation, and the Marines let loose with their machine guns and mowed down eight of them in seconds. The two

remaining soldiers realized how hopeless their plight was and turned around to go back the way they came. Most of the Marines stopped firing, but not all, and just before reaching safety, one soldier pitched forward. The lone soldier left kept running, and just as a "cease fire" order came from the CO, Sledge's buddy with the dancing girl Stateside squeezed off shots from his machine gun. Sledge was standing behind him, looking down his barrel. He saw the tracers deflect through the lone soldier's back, and he dropped. The soldier began crawling out of the hole where he fell, and the Marines began firing at him again. One Marine surprisingly told his buddies to stop shooting, saying he had no chance of survival anyway. His buddies yelled at him for defending that dying soldier, and kept firing away, finally killing him. Sledge remarked that the families of those dead Japanese soldiers would receive a letter, telling of their family's noble sacrifice, when the reality was that the soldier threw his life away on a muddy hill for no good reason at all.[\[201\]](#)

The mud and stench and maggots made for an awesome experience if a soldier slipped out of his position and slid down the steep hill he had dug into. Sledge saw it happen more than once, where a soldier lost his footing and slid down the hill, to be covered in maggots and mud when he reached the bottom, to the soldier's horror.[\[202\]](#)

Sledge called the front the "meat grinder," a huge sausage machine that continually chewed up young men and spit out its product. The attrition in the Marine ranks was awesome, with "replacement" troops coming to the front at all hours, and wounded and dead being taken to the rear. It was like an assembly line, but it was a *disassembly* line. Many soldiers die in the first moments of battle, before they learn some quick survival skills, and replacements came to the lines and went back dead or bleeding so quickly that the veterans rarely even knew their names.[\[203\]](#) On the Okinawa campaign, Sledge's battalion landed with 235 soldiers. They had 250 replacements added to their ranks, and at battle's end, only fifty men were left, only twenty-six of them were part of the original landing, for an attrition rate of about 90%.

Another psychological phenomenon accompanied the experience of that war, and the soldiers who had gone back to the states. When a Marine returned home, his letters back to his buddies reflected relief at being home, and enjoying "wine, women and song." Later letters, however, increasingly became bitter and disillusioned. Some soldiers wanted to return to the front to be with their buddies, as it was the only place they felt as if they fit in. Some did. The civilians, although often respectful of the soldier's experiences and sacrifice, also could not comprehend what the soldiers had been through. Many soldiers felt that the civilians had no idea what it was "all about," because they have had it "so easy." People like Sledge found it hard to believe that those Marines who had escaped the meat grinder wanted to return to it, until they returned to the states themselves and heard people griping about the United States because it was not perfect, or had to put up with the minor inconveniences such as standing in line to wait for a bus. The Marines saw them as whiners.

During his stay in hell, Sledge's imagination took odd flights as he watched the scene around

him. One constant companion during his ordeal on that muddy ridge was a rotting Marine in a nearby crater, an obvious replacement soldier who died by a shell, his decaying face staring up at Sledge, seeming to mock him. Sledge had to look at that decaying Marine for days. In the incessant rain, with the raindrops falling around that Marine, Sledge recalled his childhood, as he watched rain falling around a frog sitting in a puddle, the raindrops seeming like dancing elves. The Marine in the crater was similar, although those raindrops were like dancing ghouls, as Sledge's imagination wandered.[\[204\]](#)

Eventually the Marines took the "Shuri Castle," and then Sledge moved to a ridge and he and his buddies began digging in. The mud was clay-like, and each spadeful had to be forcibly knocked off, as it stuck like glue. Sledge and his buddies were under orders to dig the holes five yards apart on top of the ridge. When Sledge had dug about six inches into the mud, a stronger than usual stench of rotting flesh hit his nostrils. He was under orders and had to keep digging. A spadeful unearthed squirming maggots, and told his NCO what he was digging into, and the NCO replied, "You heard him, he said put the holes five yards apart."

Sledge kept digging, and soon unearthed buttons and parts of a Japanese army jacket. Then he hit the breastbone of the rotting Japanese soldier. Sledge was horror stricken as his shovel glanced off the ribs and hit the corpse's abdomen and made a squishing sound. Sledge was overwhelmed by the horror and stench, and yelled, "I can't dig in here! There's a dead Nip here!" The NCO came over, looked at Sledge's problem, and told him to keep digging. Just then an officer came by and asked Sledge what the problem was. Sledge showed him, and the officer told the NCO to let Sledge dig his hole a little out of alignment with the others. Sledge thankfully dug his foxhole, not straight through the Japanese corpse, but the hole he dug reeked of death. Sledge was amazed that he endured that ordeal without vomiting. Sledge's buddy in his foxhole stepped out, slipped and lost his footing. Sledge watched him slide on his belly all the way down the slope. Sledge went down the hill to help him, and his buddy, about the toughest soldier he ever met, looked with horror at that the maggots and mud that covered him, and Sledge helped clean him up.[\[205\]](#)

The battle at Shuri was finally over, and then it was right back into the meat grinder at Kunishi Ridge. Sledge's account is not one unending horror story. There are funny moments, strange encounters with belligerent Japanese POWs, buddies getting killed at odd moments, and Marines cracking up and losing their minds, regularly. One buddy, a veteran of Peleliu, went berserk and began charging at the Japanese. He was only barely restrained from his suicidal rampage toward the Japanese line.

The Battle of Okinawa was finally over, and the officers began reasserting their elite privilege over the enlisted men, and Sledge was kicked out of a nice place that he happened upon where he was eating a meal, because the area was reserved for officers. Just as Sledge grudgingly began moving from the area, a shot rang out. A Marine veteran who Sledge knew well keeled over dead, shot by his buddy, where they played a "dare you" game with a loaded

weapon they thought was empty. The man who just killed his best friend wore a shocked expression on his face continually for the next few weeks, until he was shipped off for a court martial and probable prison term. That was probably a minor inconvenience, compared to living with killing his best friend so stupidly.

The Americans finally conquered Okinawa, but there was no end in sight for cannon fodder like Sledge. Laying siege to the main islands of Japan was next, and no soldier wanted to think what that would be like. On Okinawa, the First Marine Division lost more than seven thousand men to death and wounding, more than six thousand on Peleliu, for a casualty rate of 150 percent of its strength. More than seven thousand Americans died on Okinawa, with another twenty-six thousand succumbing to psychological disorders. More than one hundred thousand Japanese soldiers were killed on Okinawa, and ten thousand taken prisoner, with another twenty thousand buried alive by either the Americans or the Japanese themselves. More than forty thousand civilians died on Okinawa in the crossfire of battle.

Just as Sledge and company began pondering the next battle, an [atom bomb was dropped on Hiroshima](#), another on [Nagasaki](#), with the Japanese surrender on August 15, 1945. It was the best news that Sledge could hear, as he felt that the Japanese would never surrender. Incredibly, Sledge was never wounded in all the fighting. The voice he heard his first night of battle was right. Sledge was an anomaly in the Marine infantry, being college educated from an upper class family. My father was an anomaly also, forsaking college to enlist in the Marines. The Marine infantry was the ultimate cannon fodder, especially in the fighting of the Pacific Theater.

Justifying the Last Good War

[Howard Zinn](#) volunteered for World War II in 1943 at the age of twenty-one, and went to bomber school. So eager to crush the Nazi evil, Zinn traded places with another man scheduled to go to Europe before he did. Zinn flew mission after mission against the Nazis. Zinn hated war, but believed that it was justified in fighting Nazi Germany. Zinn described his experiences in a chapter titled, "Just and Unjust War" in his *Declarations of Independence*. Zinn made the case that if there was ever a "just war," World War II was it.

Zinn's first exposure to war was a series of books he read at age ten, about "the boy allies," which was a series of sanitized, idealized books about heroic boys defeating the Germans. By age eighteen, those early views were largely gone, and completely shattered when Zinn read *Johnny Got His Gun*, a searing anti-war novel. Zinn hated the idea of war after reading it. Then Zinn read *The Road to War*, which described the lies and deceptions that led the American public into entering World War I.

The German sinking of the *Lusitania* is the event that finally propelled America into World War I. The [American media](#) presented the sinking of the *Lusitania* as a barbaric act against a harmless passenger vessel. It later turned out that the *Lusitania*, just as the Germans claimed, was secretly carrying munitions to Britain to be used against Germany. Such "brutal barbarity" becomes far more problematic in that light. The day the *Lusitania* sailed, Germany ran ads in American newspapers, warning Americans to not board British ships. Germany later agreed to reparations for sinking the *Lusitania*, and agreed to not sink passenger ships without warning. *All* warfare is barbaric, but the *Lusitania's* sinking, if Americans were given the facts, would not have been seen in quite the same light. Americans were [being shamelessly manipulated into going to war](#), with Americans speaking out imprisoned under the Espionage Act, which made it a crime to speak out against the war, that "war to end all wars."

Zinn was partly motivated by the class politics that directed war. The ancient Greek biographer Plutarch wrote, "The poor go to war, to fight and die for the delights, riches, and superfluities of others." It has never changed in the millennia since then. Zinn, however, was convinced that the evil of Fascism had to be stopped, and he was convinced that if there was a justified war, it was World War II. One of his war buddies constantly spoke about how the war was really a battle for empire between the imperial nations. Zinn's buddy was a member of the Socialist Workers Party. Zinn asked his buddy if he was so opposed to the war, why was he flying bombing missions as Zinn was. His buddy replied, "I'm here to speak to people like you." Zinn's buddy was killed two weeks later.

When Zinn packed up his bags after the war, he wrote "Never Again," on a folder with his war mementos. Years later, Zinn began questioning the motives, conduct and results of the heroic war against Fascism. What *did* the United States really fight for? The rights of nations to independence and self-determination?" The evidence did not support that notion. The United States had engaged in a brutal campaign against [Native Americans for a century](#), until they were nearly wiped off the map, as it expanded its national borders. Soon after the national borders extended from coast to coast, it seized [Hawaii from the Hawaiians](#), the [Philippines from Spain](#), and then engaged in a brutal, exterminatory war against the Philippine people to keep them under American control. During those same years, America continually sent its troops to Latin America to keep those nations subjugated, the kinds of activities that [Smedley Butler](#) engaged in. The United States was actively involved during those same years in carving up China into colonial spheres of influence, shared between Britain, France, Russia and Japan, brutally putting the Chinese down in events such as the Boxer "Rebellion."^[206] The notion that the United States was fighting for the freedom of foreign nations was difficult to take seriously in light of its record.

What about Fascism, that evil system? The rise of Hitler and Mussolini were [alternately cheered and sanitized](#) by the American media and politicians, with Smedley Butler being court martialed in 1931 for telling an apparently true story about [Mussolini's callous disregard for a](#)

[child's life](#). When Italy invaded Ethiopia, where industrialized warfare met African natives throwing spears at the invaders, the United States suspended munitions sales to Italy while allowing the oil companies to continue selling oil to them, fueling their war machine. During the Spanish Civil War, when Germany and Italy both helped arm the Fascists who violently overthrew the elected socialist government of Spain, Roosevelt hastily signed the Neutrality Act that shut off aid to the legitimate Spanish government. Hitler had conquered most of Europe by late 1941, and the United States did nothing. Not until Japan bombed Pearl Harbor and *Germany declared war on the United States*, did America declare war on Germany. Our government was obviously not too exercised about Fascism.

It obviously was [not a war to save the Jews](#). What about Japan? They were imperial wannabes, who wanted to control their end of Asia as America controlled Latin America. Only when Japan's expansion threatened American interests in the region, particularly the tin, rubber and oil of Southeast Asia, did America begin the steps that goaded Japan into war with America, such as closing the [Panama Canal](#) to Japan, embargoing oil and scrap iron in the summer of 1941, and freezing Japanese assets in America.

What was Japan's great, infamous act? Attacking an imperial outpost of America's, on land that [America had stolen less than fifty years earlier](#), an attack that [Roosevelt may have had foreknowledge of](#). Japan also invaded the [Philippines](#), other land that America had stolen less than fifty years previously and brutally killed about two hundred thousand of its citizens to keep our claim on their land, enslaving a nation as part of America's [Manifest Destiny](#).

America's rage at Japan seemed far less than righteous and justifiably aggrieved. While Japan was invading China and committing horrific atrocities against the Chinese people, the United States did not speak out against their barbarities. During the Rape of Nanking, Japan intentionally bombed the U.S. warship the *Panay*, sinking it and killing two people. Although the *Panay* was sunk during one of the greater acts of barbarity in modern times, what outraged Americans was that an American ship had been fired on, not that it was done in the midst of murdering hundreds of thousands of helpless Chinese citizens. Roosevelt even had footage of the attack of the *Panay* edited, so the obvious nature of the Japanese attack - intentionally attacking a U.S. gunboat - would be obscured, to support Japan's false claims that the sinking had been unintentional.[\[207\]](#)

In 1942, a Roosevelt representative assured France that the U.S. would help France keep its [colonial domain in Southeast Asia](#), a promise it honored after the war, and [then took over on its own](#), [killing millions of Southeast Asians](#), all the while saying that they were "[saving them](#)" [from Communism](#). That is the standard imperial rationale, voiced while killing millions, keeping them enslaved while telling the world it does it for its bludgeoned victims' own good. There is no self-determination argument regarding the U.S. involvement in World War II that seems to hold up, except perhaps for saving Germany's neighbors from paying German taxes.

America's overthrow of democratic movements in Italy and Greece immediately after the war gives the lie to the notion that America was fighting for Europe's freedom.[\[208\]](#)

Was World War II fought by the United States to eliminate racism? The United States is history's most racist nation. During World War II, black soldiers were segregated, treated to the military's worst living conditions, and denied jobs in the United States. A spokesman for a western aviation plant said, in response to the completely unenforced orders of the newly established Fair Employment Practices Commission, "The Negro will be considered only as janitors and in other similar capacities...Regardless of their training as air craft workers, we will not employ them."[\[209\]](#) Jim Crow still existed in the South. A student at a black college told his teacher,

"The Army jim-crows us. The Navy lets us only serve as messmen. The Red Cross refuses our blood. Employers and labor unions shut us out. Lynchings continue. We are disenfranchised, jim-crowed, spat upon. What more could Hitler do than that?"

The student's statement was repeated at an NAACP meeting to thousands of black people. The speaker was expecting the crowd to disapprove of the student's words. Instead, the speaker recalled, "To my surprise and dismay the audience burst into such applause that it took me some thirty or forty seconds to quiet it."[\[210\]](#)

The internment of more than 100,000 Japanese-Americans during World War II was deeply fueled by racist sentiments. Most of those interns were American citizens. Documents have since surfaced that the United States felt those Japanese Americans were definitely *not* a military threat to America, an opinion that John McCloy edited out of the brief given to the Supreme Court to justify Japanese-American internment.[\[211\]](#) When Japanese men escaped the American concentration camps by joining the military, they were the most decorated American regiment in the European Theater. At the same time, the remnants of the Native Americans were living in [abysmal reservation conditions](#), conditions that persist to this day.

Was America fighting for the freedom of its citizens? As in World War I, America imprisoned hundreds of people for speaking out against the war, most of them socialists, such as Zinn's bombardier buddy. Six thousand Americans were in America's federal prisons, one-sixth of the federal prison population, because they were conscientious objectors and refused to kill people during World War II. The U.S. government froze wages during World War II, while the arms suppliers attained profits only dreamed of in peacetime. McCloy was an investor in a shipbuilding company that made \$44 million on an investment of \$100,000. The workers were not so snowed, and there were more worker strikes during World War II than in any other

period in U.S. history.

Was the war fought to save civilian life in the warring nations? There is little evidence that supports that notion. In fact, Churchill specifically approved of bombing German civilians as a way of "undermining the morale of the German people." Some generals even objected to bombing civilian targets, but were overruled by their civilians governments, and the saturation bombing of German cities began, culminating with the firebombing of Dresden (napalm had only been invented a few months earlier, and was quickly used to firebomb cities), a city filled with refugees that posed no military threat, with Germany on the verge of surrender. Churchill, just as he [approved of chemical weapons being used against the Iraqi people](#), had anthrax bombs made (the war was over before he could deploy them), and called for the complete extermination of the Japanese people, identical to what Hitler said about the Jews. American planes strafed civilians trying to escape the Dresden inferno by escaping across the Elbe River. About 100,000 people, nearly all civilians, died that night. A month later, America did the same thing to Tokyo, a city that was helpless to the American bombardment. American fighter pilots could see the flames of Tokyo from 150 miles away. The planes literally chased fleeing people, dropping napalm on them. More people may have died that night in Tokyo than have ever died in any night in history.[\[212\]](#) The bombings of [Hiroshima and Nagasaki](#) were entirely directed toward civilian populations. There were even American POWs being held in those cities, and the United States knew it, but it did not dissuade them from bombing those cities, killing those "expendable" American soldiers.

After the war, Zinn slowly became aware of nagging issues regarding that last "good war." He read accounts of bombing missions that he flew, to thwart the Nazi evil. One mission he flew was on the city of Pilsen, Czechoslovakia. Those Czech citizens were among the first people to suffer from Nazi expansionism, and Zinn happily bombed them in a mission that killed several hundred civilians. He never thought of the irony of his actions while bombing those Czech civilians, the very people he was supposedly saving.[\[213\]](#)

Another bombing run Zinn participated in was the bombing near Royan, France a few weeks before the war ended in Europe. There was no military threat posed by the region. Several thousand German troops were stationed there, trapped and waiting for the war to end. The U. S. poured nearly a half million gallons of napalm on Royan, devastating German soldiers *and* French civilians.

Was it, like World War I, a war to end all wars? There have been more than 150 wars in the world since then, claiming more than twenty million casualties. The United States, the "hero" of World War II, has [killed far more people worldwide](#) since World War II than any other nation.[\[214\]](#) Nobody else comes close. Since World War II ended, the United States has been alone in the world in its unchallenged ability to send troops wherever it wants, to bludgeon whomever it wants, for the flimsiest of pretenses. The people of Vietnam, Korea, Iraq, East Timor, Indonesia, Guatemala, El Salvador, Laos, Cambodia, Nicaragua, Chile, Iran, Panama, etc.,

etc., have got to wonder what would have been worse, Germany or the United States winning World War II.

After the war was over, millions of people starved to death while the war's winners allowed it, sometimes actively, in the interest of politics. Africa was sacrificed with more intensified plantation and mining activity to help rebuild Europe. Some military leaders began denouncing *all* war. British Air Marshall Sir Robert Saundby stated after the bombing of Dresden:

"It was one of those terrible things that sometimes happen in wartime, brought about by an unfortunate combination of circumstances...It is not so much this or the other means of making war that is immoral or inhumane. What is immoral is war itself. Once full-scale war has broken out it can never be humanized or civilized... so long as we resort to war to settle differences between nations, so long will we have to endure the horrors, the barbarities and excesses that war brings with it. That, to me, is the lesson of Dresden."[\[215\]](#)

An American soldier who fought in the last "good war," Tommy Bridges, had this to say,

"It was a useless war, as every war is...How goddamn foolish it is, the war. They's no war in the world that's worth fighting for, I don't care where it is. They can't tell me any different. Money, money is the thing that causes it all. I wouldn't be a bit surprised that the people that start wars and promote 'em are the men that make the money, make the ammunition, make the clothing and so forth. Just think of the poor kids that are starvin' to death in Asia and so forth that could be fed with how much you make one big shell out of."[\[216\]](#)

One slogan [Sledge](#)'s buddies regularly uttered was, "If the country is good enough to live in, it's good enough to fight for." How was what happened in the Pacific Theater "fighting for" America? How was it protecting the United States? The only two American places the Japanese attacked (if a gas station in California, shelled by a Japanese submarine, does not count) were the Philippines and Hawaii (Japan acquired other minor American imperial holdings in those days, such as Wake Island and Guam, and Guam was also stolen from Spain in 1898). Both were American *colonies*, de facto imperial outposts recently seized. The troops that America stationed to keep the Philippine people in bondage were the same soldiers that ended up on the Bataan Death March. Where are the heroes in *that* tale? Perhaps the Philippine people who resisted the imperial overlords, whether they were Spanish, American or

Japanese. To the Philippine people it made little difference. Was the Japanese attack on Hong Kong an attack on Great Britain, half a world away? No battles took place on United States soil. Just what were our boys defending, besides imperial privilege?

Many black Americans were decidedly unimpressed with America's rationale for World War II. Zora Neale Hurston wrote,

"All around me, bitter tears are being shed over the fate of Holland, Belgium, France and England. I must confess to being a little dry around the eyes. I hear people shaking with shudders at the thought of Germany collecting taxes in Holland. I have not heard a word against Holland collecting one-twelfth of poor people's wages in Asia. Hitler's crime is that he is actually doing a thing like that to its own kind...

"As I see it, the doctrines of democracy deal with the aspirations of men's souls, but the applications deal with things. One hand in somebody else's pocket and one on your gun, and you are highly civilized...desire enough for your own use only, and you are a heathen. Civilized people have things to show their neighbors."[\[217\]](#)

That passage was from Hurston's *Dust Tracks on a Road*. Just before it was published, the Japanese bombed Pearl Harbor and Hurston's publisher removed those words from her book, which did not reappear until a 1984 edition of her book.

Dropping the Bomb

The two defining events of World War II were the Nazi death camps and dropping atom bombs on Japan. The bombings of Hiroshima and Nagasaki claimed more than 200,000 lives immediately, another 130,000 in the five years after the bombing, from radiation and other trauma, and today another 300,000 people still suffer from its effects. Those bombs affected millions of lives, few in salubrious fashion. While the German government has turned the Dachau camp into a museum (I visited it in 1974) and paid out billions of dollars in reparations to Israel, America has never, ever apologized for dropping atom bombs on Japan. Harry Truman proudly justified the atom bombs dropped on Japan long after he had left office. In 1958, regarding the bombing of Hiroshima, Truman wrote that he had "no qualms about it whatsoever." Truman's words were widely circulated throughout Japan, which led the Hiroshima City Council to state that if Truman actually wrote those words, it was a "gross defilement" of the victims of Hiroshima. The City Council finished with,

"We, the City Council, do hereby protest against it in deep indignation shared by our citizens and declare that in the name of humanity and peace we appeal to the wisdom of the United States and her citizens and to their inner voice for peace that said statement be retracted and that they fulfill their obligations for the cause of world peace."

Truman did not respond in silence. Instead, he called a press conference where he again justified the bombing, adding that it would not have been necessary "had we not been shot in the back by Japan at Pearl Harbor in December, 1941."[\[218\]](#)

Truman openly voiced the vengeance-for-Pearl-Harbor sentiments that fueled the ire of Americans during World War II. The war skeptic Paul Fussell wrote,

"Revenge is not a rational motive, but it was the main motive in the American destruction of the Japanese empire. A compiler of *An Oral History of the War Years* in America observes,

"I distrust people who speak of the (atom) bombings today as an atrocity they strongly opposed in 1945...I don't believe them. At the time virtually everyone was delighted that we dropped the bombs, not only because they shortened the war and saved thousands of American lives but also (quite irrationally, notice) because the "Japs" deserved it for the terrible things they had done to our boys at Pearl Harbor, Bataan, Guadalcanal, and all the way through the Pacific."[\[219\]](#)

After the atom bombs were dropped on Japan, the American mood was jubilant, with 23% of Americans wishing that there were more atom bombs to drop on them.[\[220\]](#) In 1995, Bill Clinton stated that the U.S. did not need to apologize to Japan because Truman made the right decision, "based on the facts before him," continuing the attitude of American presidents, with the sole exception of Dwight Eisenhower (sentiments only voiced *before* and *after* he left office), since 1945.[\[221\]](#) Gar Alperovitz may be the most prominent historian on the decision to use the atom bombs on Japan. His *The Decision to Use the Atom Bomb* is a history of the decision-making process that led to dropping the atom bombs on Japan. Using recently declassified documents, Alperovitz analyzed the decision-making process that Truman and his advisors used in deciding to atom bomb Japan.

The reasons given by America for dropping those bombs were: saving the lives of American soldiers and saving the lives of Japanese citizens that would have been spent in a prolonged siege. The rationale given was that the Japanese would not have surrendered without dropping the atom bombs on them, and the decision-making was done with the utmost care, and calculated to make them surrender. Other than making the Japanese surrender quickly, none of the stated rationales hold up, in light of the evidence.

The Manhattan Project was the biggest science project of all time, at the time (exceeded only by the [race to the moon](#)), using about 600,000 Americans in various aspects of it, and it was a top-secret project. Virtually no Americans knew anything about the Manhattan Project until those bombs were dropped on Japan. Richard Rhodes' *The Making of the Atomic Bomb* is the defining history of the Manhattan Project. After the first two bombs were dropped on Japan, another would be ready to drop about a week after the Nagasaki bombing, but Truman called it off, citing that he hated killing another 100,000 people, especially killing "all those kids."[\[222\]](#)

Today, the evidence is clear that geopolitical considerations guided the decision to drop the atom bombs, not saving American lives, or Japanese lives, particularly. For some time, it appeared as if help from the Soviet Union would be needed to subdue Japan. American policy took several flip-flops toward the Soviet involvement in the war against Japan, and by the summer of 1945, the United States was actively stalling Soviet involvement in the war against Japan. The Allies were already seeing how the post-war situation in Europe was unfolding, and the United States wanted to limit Soviet post-war influence in Eastern Asia, particularly China.[\[223\]](#) The United States began using its influence to delay the Soviet Union from coming into the war against Japan, so they could end the war decisively, in their favor, by using the atomic bomb. Just three days before bombing Hiroshima, an aide recorded in his diary that Truman and his advisors knew the Japanese were seeking surrender, and Truman was "afraid they will sue for peace through Russia instead of some country like Sweden."[\[224\]](#)

Kai Bird, while discussing the critics of Alperovitz wrote,

"Must I be trained in 'cognitive psychology' to interpret this item from John J. McCloy's July 1945 diary, written after he learned of the successful test of the bomb in New Mexico? 'I hope it does not augur the commencement of the destruction of modern civilization. In this atmosphere of destruction and the callousness of men and their leaders, the whole thing seems ominous.' Are these the thoughts of a man comfortable with the use of such a weapon on a whole city? And what about McCloy's July 23, 1945 diary reference to 'the nearness of Japanese collapse...' And what are we to make of Truman's diary statement referring to the 'cable from Jap Emperor asking for peace'? Such quotes are numerous and no amount of psycho-babble can explain them all away."[\[225\]](#)

To gain a better understanding of those days, looking into the Japanese mentality might help. By World War II, Japan was the only significant place on earth not ruled by white men. That was because Japan knew the Empire Game, and would not allow itself to get into position to be conquered. They had a warrior society that was quite insular, and their isolation protected them from the imperial powers that were conquering the globe. That insularity also put them behind technologically. Until the 1850s, Japanese military technology had not advanced beyond the musket and sword. Japan's isolation lasted until 1853, when U.S. Commander Matthew Perry stormed into Tokyo harbor in a great show of military force. The "diplomatic invasion" of Japan by Perry was humiliating for the Japanese people. Perry's mission was a wake-up call for Japan, as America forced Japan into the international arena. Instead of merely opening their land to foreign trade, Japan longed to become like the white empires, even while it hated them.

The American intrusion spelled the end of feudal Japanese society, and in 1868 a revolution happened that ended Shogun rule, elevated Shintoism to the state religion, with the installation of the Emperor as the divine, sovereign being. Militarily however, in World War II, Japan sought only to carve out an imperial domain on its end of Asia, and kick out the white men.

Japan became obsessed with catching up with the white man's world, and set itself a difficult task. In 1800, Europe, which occupied less than seven percent of the world's land, controlled thirty-five percent of it, sixty-seven percent in 1878, and eighty-four percent in 1914.[\[226\]](#) Japan was playing catch-up, and in the early 1900s it began gaining ground, although by 1938 it was still far behind the U.S., Britain and Germany, only about a third as industrialized as those nations.[\[227\]](#)

Industrialization was accomplished by [raping the world](#) and stealing the natural resources and exploiting the labor of the world's less violent nations, a pattern that continues to this day. Preventing those nations from industrializing and "needing" those resources stolen from them has been an integral part of [colonialism](#) and [neocolonialism](#). The United States and Soviet Union stole large swaths of continents, making them contiguous parts of their empires, so were able to plunder "internally," although both also raped neighbors that were not de jure parts of the empire, such as the United States in Latin America and Russia in Asia and North America, and the Great Game it played with Great Britain in Afghanistan. Island nations such as Japan and Great Britain, however, had to resort to plundering abroad, which was the essence of colonialism. For instance, pre-Hitler Germany had to import thirty-three of the thirty-five raw materials it needed for industrial production.[\[228\]](#) Along with their brutal conquest and exploitation of the world's people, Europe adopted [involved and often racist ideologies](#) to justify it, as if they were "civilizing" the world as they murdered and exploited the world's dark-skinned people.

On the eve of the Great Depression, the United States' industrial output was larger than Britain's, Germany's, France's, Russia's and Japan's output combined. The industrial capacity of the rival imperial nations would be largely destroyed in World War II, leaving the United States alone on the world stage.

Japanese society quickly evolved from feudalism to a fanatical nationalism. By 1885, Japan was fighting with China over Korea. In 1894, Japan defeated China in a short-lived war. Japan came to the table with the other imperial powers in the partitioning of China. In 1904-1905, Japan surprisingly won a war against Russia. Japan was on the Allied side in World War I, eagerly supplying arms and other goods to a white man's world at war. The aftermath of World War I, however, saw a collapse in demand for Japanese goods, and the Great Depression was hard on Japan, as it was to all industrialized nations. Unlike Germany, which received a great deal of foreign investment during the Great Depression, foreign investment bypassed Japan for the more profitable fields of China, leading to further Japanese enmity toward the West. Japan is an island nation, and it experienced a great population increase, more than doubling from 1868 to 1930, to sixty-five million people. As with other nations in its situation, increasing food imports largely fueled the population increase, and the Great Depression led to Japanese deprivation, bordering on mass starvation. Destitute Japanese fathers sold their daughters into prostitution. Japanese politicians began seeing China in much the same terms as the United States had seen the [western half of the North American continent during the previous century](#): land there for the taking, in the name of Manifest Destiny. That other peoples or nations occupied the lands mattered not. Hitler's *Lebensraum* ideology was also lifted from the American handbook, Hitler seeing Eastern Europe in much the same way that America's Founding Fathers saw North America: land there for the taking, to be cleared of "subhuman" races.

The aftermath of World War I saw a militant fanaticism grip Japan. The indoctrination of Japanese boys was intense and brutal. They were trained especially to hate the Chinese. Their study was intense. A Japanese officer had more than twice as much classwork as a British officer, and more than ten times as much private study.[\[229\]](#) Beating Japanese military students, and other tortures, was a standard part of the indoctrination process, protested by none. Ritual suicide was a dark aspect of Japanese culture, later manifesting in the Kamikaze pilots who ran their planes into American warships, a fanaticism later seen when Islamic fanatics piloted suicidal truck bombs into American barracks, and the recent [World Trade Center attacks](#). The Japanese soldiers felt they could roll over China in a few months, but when taking Shanghai alone took months, the Japanese self-image took a beating, which played a part in the brutal Rape of Nanking. Was the anti-Chinese perspective of Japan more evil than [General Sheridan](#)'s observation that the only good Indians he saw were dead? Is murder an integral part of the human condition, inevitable when populations increase?

Even after the atomic bombs were dropped, there was a fanatical faction in the Japanese military that did not want to surrender, and they seized the recording of Emperor Hirohito,

determined to die instead of surrender. They felt that the United States had ten more atom bombs ready to drop on Japan, and they could withstand it. The man who crafted the Kamikaze strategy came a meeting on August 13th, four days after the Nagasaki bomb dropped, and the day before Hirohito recorded his surrender address to Japan, with a plan to "sacrifice twenty million Japanese lives in a special (Kamikaze) attack." To this day, there may be proportionally more right-wing fanatics in Japan than in the United States, and they can be more fanatical than Americans in significant ways. Vengeance perpetrated against those who voice views at odds with the right-wing image of Japan is common.[\[230\]](#) Japan's fanatical military leaders did not prevail however, and saner members of the government did.[\[231\]](#) Hirohito made an unprecedented move when he asked the cabinet to surrender. The "god" of Japan had never before lowered himself to deal in Japan's temporal affairs. When his surrender speech was broadcast to Japan's citizens, it was the first time his voice was publicly heard in Japan. To the Japanese, it was as if their god spoke to them.

One reason for the fanaticism, however, was to protect the Emperor from war crimes prosecution, an issue that the doves in the Japanese government were united with the hawks on. The Japanese people saw the Emperor as deific. By August of 1945, Japan was a defeated nation. They were completely surrounded by enemy troops. Its navy was gone, its airforce was gone; it was not even shooting at American airplanes that flew over Japan, dropping bombs on them. They were defeated. The Japanese had been exploring surrendering for more than a year when the atom bomb was dropped on Hiroshima. After the U.S. victory at Saipan in July of 1944, the Japanese saw the writing on the wall. Allied forces were rolling across Europe at that time, and all observers knew it was only a matter of time before Japan and Germany were defeated. The Japanese began exploring surrender options in July 1944, and America knew it. The United States had cracked the Japanese code before Pearl Harbor, and knew the contents of all Japanese cables during the war.

The Japanese government naturally wanted "good" peace terms in the early stages, and was anxious to negotiate a peace. Our government was aware of the contents of those Japanese cables, but did not publicly admit that they knew what was in the Japanese cables until 1960, and only in recent years has our government, in response to Freedom of Information lawsuits, begun revealing what it knew during World War II about Japanese intentions.

By May of 1945, when [Eugene Sledge](#) was living in hell on Okinawa, the bulk of the Japanese military was eager to surrender, even under hard terms, provided they were somewhat honorable. The only condition the Japanese were asking for was sparing the imperial family from retribution. The emperor was involved heavily in the war and Japan's monstrous war crimes. It is a vile tale, no doubt, yet letting one man off the hook was all the Japanese people were asking for. Their sentiments are easily understandable. Hirohito was a religious figure. Imagine how the British people would have reacted if the Germans wanted to publicly execute the King of England as a term of surrender. The British people might have fought to the last man to prevent that from happening, and the Japanese were far more fanatical than the British

regarding their royalty.

Today's evidence shows that the United States government acted about as Machiavellian as any government ever has. While American boys were fighting and dying on the islands surrounding Japan, the American government was playing chess with world, especially Eastern Asia. The United States government, including Roosevelt and Truman, knew the trajectory of Japanese surrender sentiments as they unfolded. The Japanese only wanted to preserve their emperor, and would fight to the last man to do that, which all U.S. diplomats knew it quite well. The United States, throughout the period of Japanese exploration of surrendering, continually stressed that surrender had to be "unconditional." The only condition that the Japanese wanted by May of 1945 was to retain their Emperor, and our government knew it.[\[232\]](#) The underlying reasons for stalling Japanese attempts to surrender appear to be several:

1. The [revenge for Pearl Harbor](#) theme;
2. The United States government was playing chess with the Soviet Union, and its eye was firmly on what the post-war world would look like, with the defeat of Japan an inevitability that the policymakers were already looking far beyond; the United States government wanted to limit the Soviet Union's influence in Eastern Asia after the war, especially in China;
3. The atom bomb was the "ace in the hole" that the United States was eagerly waiting to play; it would be a demonstration of power to the Soviet Union that they could not ignore; the desire to demonstrate the bomb before the world was calculated to have maximum impact on the Soviet Union.
4. Using such a horrific weapon on the Japanese was logical, given the hatred that Americans held for the Japanese, a hatred that far exceeded American animosity toward the Germans, for instance; undoubtedly, racist sentiments had much to do to with it, in the most racist nation of all time.

James F. Byrnes was a critical player in the decision to drop the atom bombs on Japan. Truman appointed Byrnes as the Secretary of State in the summer of 1945, Truman trusted Byrnes, and next to Truman, Byrnes was the key player in American foreign policy in the last days of the war.

Alperovitz wrote,

"...the then available evidence 'strongly suggested' that the view James F. Byrnes had reportedly urged to three atomic scientists (also in May 1945) was an accurate statement of policy: 'Mr. Byrnes did not argue that it was necessary to use the bomb against the cities of Japan in order to win the war....Mr. Byrnes'....view (was) that our possessing and demonstrating the bomb would make Russia more manageable in Europe.'"[233]

The evidence today strongly supports that notion, and was voiced by other people besides Byrnes. Brigadier General Leslie Groves ran the Manhattan Project, and he expressed [the same sentiments to Manhattan Project scientists](#). [234]

Here is an example of how those making it viewed the atomic bomb. By the spring of 1943, the Allies were gaining on all fronts, and the end of the war was becoming inevitable. The early and easy victories of the Germans and Japanese had turned into a grinding battle of attrition, and the Allies had far more industrial resources and men to throw at it. The Allies never really pulled off any easy victories over the Japanese and Germans; they simply could absorb the attritional losses better. By late 1943, the war's eventual outcome was apparent. The Germans overextended themselves with the invasion of the Soviet Union, a miscalculation that climaxed in the winter of 1942-1943 with the Nazi disaster at Stalingrad. The Allies also began winning in North Africa in late 1942. By the summer of 1943 the Allies invaded Italy. The Americans won the battle of Guadalcanal and the [Solomon Islands](#) by early 1943, the pivotal battle of the Pacific. The decisive battles of the Coral Sea and Midway happened in the spring of 1943.

In April of 1943, the Manhattan Project began building a factory to produce wire mesh with nickel plating, made by a process called the Norris-Adler process, after its inventors, which resisted corrosion better than copper, which was failing. The nickel mesh wire would do the job in the diffusion process used to [separate Uranium-235 \(U-235\) from the Uranium-238](#). In October 1943, a barrier more promising than the "Norris-Adler" screens was invented. The "Norris-Adler" screens were adequate to get enough U-235 to make the atom bombs, and changing barriers would delay the making of an atom bomb for months. Harold Urey, the 1934 Nobel Prize winner in chemistry for his discovery and isolation of deuterium (the first elemental isotope ever isolated), which was an important part of making nuclear weapons, came into a heated conflict with Groves regarding the conversion to the new barriers. Urey argued that changing barriers in midstream would delay making the atom bomb by months. By January of 1944, Groves authorized the switch to the new process. Rhodes writes,

"By changing barriers rather than abandoning gaseous diffusion he confirmed what many Manhattan Project scientists had not yet realized: that the commitment of the United States to

nuclear weapons development had enlarged from the seemingly urgent but narrow goal of beating the Germans to the bomb. Building a gaseous-diffusion plant that would interfere with conventional war production, would eventually cost half a billion dollars but would almost certainly not contribute significantly to shortening the war meant that nuclear weapons were thenceforth to be counted a permanent addition to the U.S. arsenal. Urey saw the point and withdrew [he resigned his position - Ed.]; 'from that time forward,' write his colleague biographers, 'his energies were directed to the control of atomic energy, not its applications.'"[235]

In light of that event, shortening the war was obviously not the top priority of the Manhattan Project, but part of a longer-term strategy, which Groves said was "to subdue the Soviets." The Cold War was already being waged in earnest, and World War II was far from finished.

After the bombs were dropped, the people in the decision-making process began a propaganda campaign to cast their decision-making in a more benign light, beginning with [Truman's announcement of the bombing](#). They began justifying the atomic bombing of Japan as saving American lives. Truman held to that position until he died. Truman is popularly known in America as one of the most honest politicians that America has ever had. Unfortunately, that might be true. The record today shows that Truman's announced "million" casualties was never at any time the number that was thrown around when the decision to atom bomb Japan was made. Alperovitz and other historians have combed the record as thoroughly as possible, and the highest estimate ever made during the planning process was that 46,000 American deaths might result from a full-scale invasion of Japan, and the only estimate Truman ever saw arrived at a number of around 8000 American deaths.[236] The "million casualty" statement, made many times in later years by Truman and others appears to be an outright fabrication, justifying in retrospect what was done. The "expendable" cannon fodder in the Pacific was obviously relieved to hear that the war was over, but it does not appear that saving their lives was too high on the decision-makers' list of priorities. Paul Fussell has been one of the most vigorous defenders of dropping the bomb, mainly because he would have been shipped from Europe for the invasion of Japan, something that no American in the European Theater relished. The "anybody but me" view of the cannon fodder is understandable, but does not make bombing Hiroshima "righteous."

Truman was a standard American politician. He lied tellingly and repeatedly about the atomic bombing of Japan and the decision-making process that led up to it. While announcing the bombing, he told America that [Hiroshima was a military base](#), but the reality was that first people incinerated by the Hiroshima bomb were patients in hospital beds and children playing on a playground.[237] The real reason Hiroshima was bombed was because it would make a showcase for the bomb's devastating power. Hiroshima was one of the few Japanese cities not yet reduced to rubble, precisely because it was of little military significance. The planners

wanted to bomb a city that was relatively intact, which is why they chose Hiroshima and Nagasaki. Declassified files have shown that the initial criteria for selecting the atomic bomb targets were:

"(1) they be important targets in a large urban area of more than three miles diameter, (2) they be capable of being damaged effectively by a blast, and (3) they are likely to be unattacked by next August."[\[238\]](#)

The Target Committee also noted,

"that psychological factors in the target selection were of great importance. Two aspects of this are (1) obtaining the greatest psychological effect against Japan and (2) making the initial use sufficiently spectacular for the importance of the weapon to be internationally recognized when publicity on it is released."[\[239\]](#)

Hiroshima was initially on the list partly because of "the advantage of being such a size and with possible focusing from nearby mountains that a large fraction of the city may be destroyed."

As Alperovitz summarized the memorandums and thinking that went into the bombing decision he wrote, "This meant targeting large numbers of civilians."[\[240\]](#) Such a decision was a direct violation of the Geneva Convention. According to the standards used at Nuremberg, Truman and his advisors (and others such as Churchill) should have been at the business end of a hangman's noose for bombing Hiroshima, and especially Nagasaki, which appears to have been the biggest human experiment ever carried out.

Similar to the issue of bombing Auschwitz to save Jewish lives, the issue has come up about dropping the atomic bomb and why a city was targeted. Could a bomb have been dropped on an uninhabited island, with Japanese officials watching what the Americans could do to Japanese cities, and having that awesome display of power bend the Japanese into submission? The standard answer by establishment apologists is that such a tactic was considered but rejected as being impractical or uncertain. The facts are that even though a survey showed that Manhattan Project scientists were overwhelmingly in favor of

demonstrating the power of the atomic bomb to the Japanese before it was dropped on the Japanese people, giving them a chance to surrender, and even people such as George C. Marshall cautioned against using the bomb on civilians without first demonstrating it on a military target, that strategy was never seriously considered by any of the decision-makers, and the representatives of the Manhattan Project scientists never made a peep of protest when informed of how the bombs would be used.[\[241\]](#)

In addition, extreme secrecy was used regarding dropping the bomb. The decision-makers were against any warning to Japan about what was going to happen. Although in the later propaganda years, Hollywood would depict America as dropping leaflets to warn the Japanese of the Hiroshima bombing, that notion is a complete fabrication.[\[242\]](#)

Alperovitz stressed that Truman and his advisors did not choose to drop the atom bombs out of,

"...evil intent. Their motives, broadly speaking, were good; their intentions well-meaning. Mainly they were people who had experienced two world wars in one generation who did not want to see a third one occur - and who believed the new weapon gave them the power to shape events to achieve a truly enduring peace."[\[243\]](#)

Henry Stimson, the Secretary of War at the time of the bombing, wrote that those who decided to bomb Hiroshima were "very fine men," but they "should have known better."[\[244\]](#)

Alperovitz wrote,

"Around the world Americans are famous for a certain naive self-righteousness, even arrogance. We like to see ourselves as possessed of special, unique virtue. Ours is a great nation. So long as we accept a distorted, overly idealized image of ourselves and our society, however - so long as we see all "good" here and all "evil" elsewhere - I believe we must inevitably err in our relationship with others. Many of the excesses of the Cold War - and the overreaching that produced the Vietnam War - can be traced in part to such attitudes."[\[245\]](#)

In essence, Alperovitz enunciated the attitude of Nazi Germany as it marched off to war, as

Japan did, as Britain, Portugal, France, Holland and Spain did when [they conquered the world](#), etc. The self-image that Americans have is the same one that all imperial societies have. It amounts to, "We are the good guys." Because we accept that "self-evident truth," as seen through our eyes, we blithely justify Hiroshima and Nagasaki. We [cheer acts such as the Gulf War](#). We stand by as our national apparatus bludgeons [Guatemala, El Salvador, Panama, Vietnam, Chile, Iran](#), Nicaragua and so on. We inflict great evil on others, while telling ourselves that we are the good guys. Hitler thought the same way, as does every butcher and mass murderer. The [means become the ends](#). They always have, and always will.

Alperovitz' monumental scholarship has been predictably attacked by American establishment defenders. When his seminal *Atomic Diplomacy* was published in 1965, it was stunning in its thesis: "the atomic bomb was not needed to end the war or to save lives." America's intelligentsia was highly critical of his work. Alperovitz was the first one to make public the issue of [James Byrnes](#) and others stating that the reason for the Hiroshima bombing was "to make Russia more manageable." The main problem in getting to the bottom of it was the veil of secrecy that the U.S. government threw over the entire affair, with many critical documents only being declassified recently, with the most critical documents likely still classified or destroyed, in standard American fashion. It was not until 1960 that the informal names of the bombs, Fat Man and Little Boy, were declassified. The mainstream media has generally been the establishment's mouthpiece on these issues, uncritically repeating whatever the government tells them.[\[246\]](#) The most involved account to ever appear on network television was in 1965, in the documentary titled *The Decision to Drop the Bomb*. It was far from even-handed, and ended up recapitulating Stimson's lies, but it is the most frank account ever appearing on network television. American is still a nation in denial regarding Hiroshima, more than fifty years since it happened.

Alperovitz was the first to claim that Truman delayed the Potsdam Conference until America could test an atomic bomb. At the time, he was attacked for such observations, but today they are widely accepted in scholarly circles, even if our politicians and mainstream media continue to deny it. In 1978, the discovery of Truman's "Potsdam Diary" confirmed key Alperovitz claims. Truman wrote about the diplomatic value of the bomb, "I have an ace in the hole." He wrote before the bombing, "telegram from Jap Emperor asking for peace." Truman was well aware that the threat of Russia entering the war against Japan would lead to their immediate surrender, which was why they tried delaying Russia's entrance into the Asian war. The picture became clearer, and Alperovitz' "radical" scholarship was vindicated.[\[247\]](#) Along with Alperovitz, British physicist Patrick Blackett was vindicated. He was the 1948 Nobel laureate for his work in nuclear physics, knighted for his work. He wrote the first book to challenge the Disneyfied version that Secretary of War Henry Stimson and others concocted long ago. Blackett's book was titled, *Fear, War and the Bomb*, published in the 1940s. Blackett called the Hiroshima bombing the first shot of the Cold War.

Nearly all attacks on Alperovitz' work are the standard [name-calling, emotionally stunted,](#)

[irrational tracts](#). One Alperovitz critic asked if there was any significant difference between conventional bombing and the atomic attack on Hiroshima. One charge laid at Alperovitz' feet is that he is a grown-up Vietnam-era hippie type, revising history with his leftist [presentism](#). Alperovitz' received his Ph.D. in 1964, and *Atomic Diplomacy*, his first contribution to the field, was published in 1965, long before the hippies (called bums and beatniks in earlier generations) began showing up in America, long before Americans (besides Chomsky and his friends) questioned Vietnam. Another falsehood is the notion that questioning the atomic bombings is something that has come up recently, due to research such as Alperovitz'. Many prominent members of the U.S. government were critical of bombing Hiroshima and Nagasaki *when they happened*. There is virtual unanimity that the bombing of Nagasaki was a great crime, not justified by any stretch of the imagination.

Nagasaki was probably a human experiment. A different kind of bomb was used at Nagasaki, a plutonium bomb, which worked completely differently than the uranium bomb dropped on Hiroshima, never detonated before it was dropped on Nagasaki. The Trinity test was with a plutonium bomb, but the Nagasaki one was being dropped from a plane. They almost did not drop the Nagasaki bomb because cloud cover obscured the target, but they did not want to "waste" the bomb by dropping it into the ocean or taking it back home, so they dropped it miles from the target. It was an experiment, used on human beings, for almost no reason other than seeing if it would work. Nagasaki happened three days after Hiroshima, not giving the Japanese time to digest it. There was no pressing need to rush things in the wake of Hiroshima, other than keeping the Soviets from gaining too much influence in Eastern Asia.

Here is a sampling of opinion by men who are obviously not revisionist scholars, and what they thought of dropping the atomic bombs.

"...the Japanese were ready to surrender and it wasn't necessary to hit them with that awful thing." - **Dwight Eisenhower**.[\[248\]](#) Eisenhower was the leader of the Allied forces in Europe during World War II and President of the United States in the 1950s.

"It is my opinion that the use of this barbarous weapon at Hiroshima and Nagasaki was of no material assistance in our war against Japan. The Japanese were already defeated and ready to surrender because of the effective sea blockade and the successful bombing with conventional weapons.

"The lethal possibilities of atomic warfare in the future are frightening. My own feeling was that in being the first to use it, we had adopted an ethical standard common to the barbarians of the Dark Ages. I was not taught to make war in that fashion, and wars cannot be won by

destroying women and children." - **William Leahy**.[\[249\]](#) Leahy was the Chief of Staff to Presidents Franklin Roosevelt and Harry Truman.

On May 28, 1945, Herbert Hoover visited President Truman and suggested a way to end the Pacific war quickly:

"I am convinced that if you, as President, will make a shortwave broadcast to the people of Japan - tell them they can have their Emperor if they surrender, that it will not mean unconditional surrender except for the militarists - you'll get a peace in Japan - you'll have both wars over."[\[250\]](#)

On August 8, 1945, two days after Hiroshima was bombed, Hoover wrote to *Army and Navy Journal* publisher Colonel John Callan O'Laughlin, "The use of the atomic bomb, with its indiscriminate killing of women and children, revolts my soul."[\[251\]](#)

Herbert Hoover was the U.S. President from 1929 to 1933.

Douglas MacArthur's biographer William Manchester has described MacArthur's reaction to the issuance by the Allies of the Potsdam Proclamation to Japan:

"...the Potsdam declaration in July, demand(ed) that Japan surrender unconditionally or face 'prompt and utter destruction.' MacArthur was appalled. He knew that the Japanese would never renounce their emperor, and that without him an orderly transition to peace would be impossible anyhow, because his people would never submit to Allied occupation unless he ordered it. Ironically, when the surrender did come, it was conditional, and the condition was a continuation of the imperial reign. Had the General's advice been followed, the resort to atomic weapons at Hiroshima and Nagasaki might have been unnecessary."[\[252\]](#)

Norman Cousins consulted for General MacArthur during the American occupation of Japan.

Cousins wrote, "MacArthur's views about the decision to drop the atomic bomb on Hiroshima and Nagasaki were starkly different from what the general public supposed." He continued, "When I asked General MacArthur about the decision to drop the bomb, I was surprised to learn he had not even been consulted. What, I asked, would his advice have been? He replied that he saw no military justification for the dropping of the bomb. The war might have ended weeks earlier, he said, if the United States had agreed, as it later did anyway, to the retention of the institution of the emperor."[\[253\]](#)

Douglas MacArthur was Dwight Eisenhower's counterpart in the Pacific, in charge of the Allied troops fighting Japan during World War II.

Those men are not a bunch of hippies who grew up during the Vietnam War. There were many, many others with positions similar to those men who were appalled by dropping the bombs on Japan. Here is one example of what might have been, but was ignored in the rush to use the bomb.

"On June 28, 1945, a memorandum written by Under Secretary of the Navy, **Ralph Bard** the previous day was given to Secretary of War Henry Stimson. The memorandum stated in part,

"Following the three-power [July 1945 Potsdam - Ed.] conference emissaries from this country could contact representatives from Japan somewhere on the China Coast and make representations with regard to Russia's position and at the same time give them some information regarding the proposed use of atomic power, together with whatever assurances the President might care to make with regard to the Emperor of Japan and the treatment of the Japanese nation following unconditional surrender. It seems quite possible to me that this presents the opportunity which the Japanese are looking for.

"I don't see that we have anything in particular to lose in following such a program.' He concluded the memorandum by noting, 'The only way to find out is to try it out.'"[\[254\]](#)

Albert Einstein would later say,

"I made one great mistake in my life - when I signed the letter to President Roosevelt

recommending that atom bombs be made, but there was some justification - the danger that the Germans would make them."[\[255\]](#)

George Kennan, one of the [most fervent Cold Warriors](#), wrote the following, in "A Christian's View of the Arms Race,"

"(T)he readiness to use nuclear weapons against other human beings - against people whom we do not know, whom we have never seen, and for whose guilt or innocence is not for us to establish - and, in doing so, to place in jeopardy the natural structure upon which all civilization rests, as though the safety and perceived interest of our own generation are more important than everything that has ever taken place or could take place in civilization: this is nothing less than a presumption, a blasphemy, and indignity - an indignity of monstrous dimensions - offered to God."[\[256\]](#)

The U.S. Strategic Bombing Survey in 1946, commissioned by Truman himself, concluded that the Japanese would have surrendered by the end of 1945, even if they were not invaded, even if the Soviet Union had not declared war, and even if the atomic bombs were never dropped.

These are not very controversial issues, but the United States has never apologized for its monstrous behavior, not just to Japan, but to the world. Being the world's most powerful nation means never having to say you are sorry, no matter how atrocious your behavior. As with the [Gulf War](#), as with [annihilating America's natives](#), as with [Vietnam](#), as with [Yugoslavia](#), this nation has never performed the introspection of asking itself why we did it, what was glorious about it, what those people did to deserve our genocidal violence, etc. As long as we never perform that introspection and no greater power stunts our violence, we will continue to do it.

As with the [Jewish Holocaust](#), there are dots of light in the black firmament that hovers over the Hiroshima and Nagasaki bombings. In 1954, Norman Cousins successfully agitated for "Hiroshima Maidens" to come to the United States for surgery to try healing their disfigurement from the atom bombing. They were warmly received by many, yet the U.S. government was extremely nervous about those maidens being in America, fearing that there would be anti-nuclear criticism following in the wake of Americans witnessing what the bomb did to Japanese citizens. The arrival of the Hiroshima Maidens was the first time that the American public openly saw the results of the atom bombs. Until that time, the footage of the aftermath of Hiroshima and Nagasaki was a state secret. The Hiroshima Maidens played a part in the

healing that has taken place between America and Japan. The Maidens accepted their state, consistent with their religion and worldview, and did not blame America. Also, there were more than a thousand nuclear-disfigured American citizens living in America at the time, generally Nisei who were trapped in Japan when the war broke out, bombed by their own government, as with those dozens of American POWs held at Hiroshima and Nagasaki, whom our government knew full well were down there when the atom bombs were dropped.[\[257\]](#)

[At present](#), my home state of Washington will be dealing with the issue of nuclear weapons for the next two hundred thousand years or so, with the immense wisdom that led to the Hanford facility, a facility that is leaking plutonium today into the Columbia River. Since [civilization](#) is about seven thousand years old, it took some incredible foresight to plan for 200,000 years into the future so we could subdue Japan.

The issue here is not condemning Truman, Hitler or anyone; it is deflating the moral superiority that Americans have adopted regarding that war, and all wars since, thinking that they are the force of light and righteousness, defeating the forces of evil as they bomb helpless Vietnamese farmers, Iraqi conscripts, Yugoslavian peasants, Panamanian tenement dwellers, pharmaceutical factories, Afghanistan "rebels" that America armed and incited, etc. The greatest evils are committed by the self-righteous. During World War II, the killing had escalated to such levels that incinerating a city or two was not out of step with the times. Nuking Hiroshima was a sign of the times, times that my parents grew up in.

Some More Myths

In Michael C.C. Adams' *The Best War Ever*, he noted that contrary to the popular image, most returning soldiers from World War II did not get parades, were often "treated like scum," and one anonymous soldier said, "If you ever got the boys all together they will probably kill all the civilians."[\[258\]](#)

No American or Japanese newspaper carried any stories of atrocities carried out by their own soldiers, although there were plenty. White American servicemen beating and killing black servicemen was covered up. The media, similar to today in many ways, were [government cheerleaders, not journalists](#). The scene of MacArthur wading ashore on his return to the Philippines was staged and filmed several times until they got a take they liked. The famous picture of Marines raising the flag at Iwo Jima was of the second flag being raised, the first not being large enough to satisfy the Marines. Patton, Eisenhower and other icons staged their famous photos, such as at Normandy and Sicily. The American film industry was in overdrive, churning out endless movies about the noble Allies and the evil enemy. When disfigured soldiers from the plastic surgery hospital in Pasadena were allowed to go downtown, the

newspapers received letters that asked why the soldiers were let out, and asked why they could not be "kept on their own grounds and off the streets?"[\[259\]](#)

The average American soldier did not say a sentence that did not have a four-letter word in it, and their favorite noun, verb and adjective began with the letter "f." The phony war movies starring John Wayne and other jingo-actors unfortunately influenced a generation of boys who went to Korea and Vietnam, thinking that they were somehow saving the world from evil as they bombed Korean and Vietnamese farmers and their families. The Reagan-Bush boys attempted to regain the mythos of World War II. Reagan was an actor who was in those World War II movies as Wayne was, and Saddam Hussein was turned into the next Hitler by Bush's lying rhetoric. Reagan was living in a fantasy world so delusional that he told war stories as if he had lived them, but they were really scenes from movies he was in or saw. Reagan never left America's shores as a soldier and never saw combat, but he told war stories.[\[260\]](#)

For a man who gave shoot-to-kill orders to the National Guard, to be executed against protesting students while he was the governor of California, for a man who liked telling jokes about black people, for a man who presided over the genocide in [Central America](#), for a man who hated the Soviet Union and did his best to conquer it, as well as an eager collaborator of Joe McCarthy's witch hunts,[\[261\]](#) a man with his delusional wartime fantasies, for a man who was a failed artist (he played the straight man to a chimpanzee) who resurrected his fortunes when he pursued politics, for a man who ran for office on the platform of making his nation great once more, citing a golden age that never was, Reagan had many parallels to Hitler. The accounts we can now read about both men, where they were nearly incoherent in private conversation, yet those around them, including the press, portrayed both men as [dazzling conversationalists](#), gives one pause. For the death toll they racked up, they were different, but in other ways, they were blood brothers. Hitler was a real soldier; Reagan was a fake soldier. Hitler euthanized the mentally ill; Reagan threw them onto the streets to fend for themselves. I met Reagan's handiwork on the streets of skid row Los Angeles everyday. Compare the Nuremberg rallies to the Democratic and Republican conventions in American politics. Reagan presided over the [biggest imprisonment effort](#) the world has seen since...Hitler's concentration camps and Stalin's gulags. As a child, I had to say the [pledge of allegiance](#) every day to begin school. How different was my indoctrination than what a German child underwent? As I was saying my pledge to the flag, with my hand over my heart, my nation was [killing millions of "subhuman gooks" in Southeast Asia](#) for the crime of wanting to be free. We were able to pull off invasions that Hitler could only dream of, sending troops across a vast ocean to annihilate the "enemy."

World War II built the military-industrial complex that Eisenhower warned about. Joe Marcus was the head of the Civilian Requirements Division in World War II. Marcus later reflected, "the single most important legacy of the war is...the military-industrial complex. In the past, there were business representatives in Washington, but now they *are* Washington."[\[262\]](#)

During World War II, an empty-headed nationalism took over American brains. Critical thinking was out, and being a member of the team (herd) was what counted. Nearly two-thirds of American soldiers in World War II were drafted. The baby boom began during the war, as millions of men got married and immediately had a child to avoid being drafted. As with Vietnam, the college deferment was available, which got the middle and upper class men out of combat, loopholes that [have been available for the rich](#) in every single American war. Being a conscientious objector was a felony offense.[\[263\]](#) Gandhi and Jesus would have been felons in America. "Thou shalt not kill" did not apply when there were enemy to kill, whether they were Japs, Injuns, Krauts, Rag Heads or Gooks.

The military hierarchy in the regular Germany army was far more democratic than America's, encouraging camaraderie between officers and enlisted soldiers, radically different from the caste system that pervaded the American and British ranks. The German, British and Japanese soldiers were considered far more capable than American soldiers. The German arms were generally of much better quality than American arms, such as the Panzer versus the Sherman tanks, where the military planners calculated that it took five Sherman tanks to take out one Panzer. Proportionally, minorities like Mexican-Americans and Native Americans served in far higher numbers than the white population. The discrimination against them was evident, but was the most extreme with African-American soldiers, who served in segregated regiments. Blacks generally did not serve in combat, mainly because carrying a weapon was a traditional way to claim full citizenship rights. The Blacks rode on the back of the bus, cleaning out the stables, for World War II. One striking American worker during the war said, "I'd rather see Hitler and Hirohito win the war than work beside a nigger on the assembly line." That worker was expressing common sentiments in America, which was the majority opinion in the South and West.[\[264\]](#) During the "zoot suit" riots in 1943, American servicemen roamed Los Angeles, beating up any Mexican-Americans they found. The Japanese-Americans were already locked up, so they were not assaulted.

One more minimized aspect of the war was homosexuality in the foxholes. In itself, it was understandable and nothing was wrong with it, but the military had long associated manliness with heterosexuality, and witch hunts for homosexuals regularly swept the American military ranks. There is nothing "wrong" with homosexuality. Many soldiers engaged in it not because they were homosexuals by nature, just as few prison inmates are homosexuals by choice. If people are desperate for food and sex, they will get it however they can. There was also widespread discrimination against women in the American military. It was a rather backward attitude compared to Europe, where British female officers commanded men. The American infantry, as in all armies, was manned by America's lower classes. Most combat soldiers coveted the [million-dollar wound](#). Divorces in America hit their all time high during World War II.

The British, for instance, did not look at black American soldiers as "niggers," but just as American soldiers. British women who dated black American soldiers, however, were subject

to being beaten up by American soldiers, and American soldiers killed people over white women dating blacks, several times, in Britain.[\[265\]](#) The Americans harbored racist hatred for the Arabs and Japanese particularly, but they could even be boorish toward their French and English allies for their "primitive" ways, such as not having refrigerators in their homes.

Seventy-five percent of American soldiers admitted to having sex while overseas, and World War II veterans have told me stories, such as in the Philippines, where having sex with the local women (who were reduced to prostitution) was a long-standing pastime for imperial troops. Those kinds of war stories are not told at family picnics. The American men were considered the most sexist and racist of the Allies. Any woman associating with American soldiers was immediately suspected of being a prostitute. More American soldiers were casualties of venereal disease in Northern Europe than of the V-2 rocket, and during the Italian campaign, venereal disease caused more casualties than battle.[\[266\]](#) A similar trend also happened at home, with the venereal disease rate of girls aged fifteen to eighteen doubling between 1941 and 1944, in New York City.

More than a quarter of all American casualties were psychological problems, usually called shell shock. My ancestors came back from war "changed" men. The common epithet for men getting shell shock was "coward," and Patton hit men who suffered from it. Even the most heroic got shell shock. [Audie Murphy](#), perhaps the greatest war hero America ever produced, suffered from shell shock for the rest of his life. One reason shell shock was so much higher with Americans than other nations (Germany's was less than 2%) was that America had a huge bureaucratic military structure that had only about 20% of its soldiers slated for combat, with the rest performing support duties. Consequently, those 20% had no relief, as the whole effort depended on them. They were the true cannon fodder, and they were doomed men in the heat of the Asian and European theaters, with casualty rates so high that a soldier was almost guaranteed to get maimed or die, which led to playing Russian Roulette and other suicidal behaviors. "Take no prisoners" was the motto of even Audie Murphy. Machine gunning a parachuting soldier who had bailed out, torturing prisoners to death to gain information, killing surrendering soldiers, etc., were behaviors that every army in World War II displayed.

At home, history books were revised to minimize or delete the parts that dealt with slavery or the dispossession of the natives, because it promoted "disunity." Unsupervised youth began getting drunk, vandalizing property and joining gangs. One way for women to show their patriotism was by having sex with soldiers. It is estimated that 85% of the women who lived near army camps and had frequent sex with soldiers in America did not charge.[\[267\]](#) They were called Victory Girls, and many if not most were teenagers. Once the war was over, Rosie the Riveter was supposed to go back home and get pregnant. When Valium hit the market in the 1950s, the biggest customer class was American housewives, getting the newspaper, slippers and pipe ready for her man for his return from the factory. *Leave it to Beaver* and *Ozzie and Harriet* only existed in Hollywood's imagination. *All in the Family* was more realistic.

Hitler's entire program was based on a racist nationalism, just as in the United States (the original [U.S. Constitution](#) exempted slaves and natives from having those "inalienable rights"). Hitler was not as much of an aberration as Westerners like pretending. He was in significant ways the Western mentality's logical conclusion. Hitler may have done the world a favor, in the end, taking commonly-held attitudes to their logical extreme.

World War II was not a Golden Age. General Gene LaRocque told Studs Terkel,

"...I had been in thirteen battle engagements, had sunk a submarine, and was the first man ashore in the landing at Roi. In that four years, I thought, What a hell of a waste of a man's life. I lost a lot of friends. I had the task of telling my roommate's parents about our last days together. You lose limbs, sight, part of your life - for what? Old men send young men to war. Flags, banners, and patriotic sayings...

"You could argue that World War Two had to be fought. Hitler had to be stopped. Unfortunately, we translate it unchanged to the situation today...

"I hate it when they say, 'He gave his life for his country.' Nobody gives their life for anything. We steal the lives of those kids. We take it away from them. They don't die for the honor and glory of their country. We kill them."[\[268\]](#)

After the Bomb

After two atomic bombs were dropped on Japan in the span of a few days, Japan surrendered. It was no surprise that the Japanese surrendered after two cities were incinerated. The United States government fully expected it. In one of the many ironies of Japan's surrender, although the Americans stonewalled the Japanese surrender with their "unconditional" mantra, after the Japanese surrendered the Allies did exactly what the Japanese wanted: spare Hirohito from prosecution and humiliation. Hirohito remained an untainted emperor until his death in 1989. It appears that retaining Hirohito was a useful strategy for the United States, as a way of controlling post-war Japan, keeping them from going communist or some other unfavorable (from the U.S.' perspective) path. The last several months of fighting, particularly the kind of fighting that [Sledge](#) participated in, never needed to happen, as if any of it ever "needed" to happen. That must be a devastating realization, if ever achieved, for those who survived the Pacific Theater battles in 1945, and the families that lost sons in those battles, both American and Japanese.

Bombing Nagasaki was not the last act of the war. The Japanese were not engaging in attacks at that time. They were a defeated people, reduced to huddling under the American bombardment. Hiroshima was bombed on August 6, 1945, and Nagasaki on August 9th. On August 14th, as Hirohito was making his surrender speech, Hap Arnold, who ran the Army Air Force (the Air Force as such did not yet exist) staged what is called the Grand Finale. It was something like our Fourth of July fireworks, celebrating what a great nation we are. The Grand Finale was this: Arnold wanted to get more than 1000 planes in the air at one time, for one last glorious bombing of Japan. On August 14th, Arnold accomplished his enormous task. He got 1014 planes aloft for one last bombing run on the main Japanese island of Honshu. Those planes dropped twelve million pounds of bombs on Japan that day, half as much explosive power as was dropped on Hiroshima.

Noam Chomsky, who was sixteen when the bombs were dropped, was "shocked" by the atomic bombing. He did not talk about it with his friends, because nobody seemed to care. Chomsky said about the Grand Finale, "That one didn't kill as many people as the atom bombs, but in a way it's more depraved."[\[269\]](#) The planes dropped leaflets with those bombs during the Grand Finale, informing the Japanese civilians below that Japan had surrendered. America delivered the news with the bombs. Japan had been reduced nearly entirely to rubble by that time. In the spring of 1945, Arnold informed Major General [Curtis LeMay](#), who eventually ran the Strategic Air Command in the United States, that by October 1945, there would be nothing left in Japan worth bombing: the entire nation would be in ruins.[\[270\]](#) Arnold wrote the same in his diary in June 1945. When I have mentioned the Grand Finale to my fellow Americans, they either say in bewilderment, "no!" or they stare at me with an amazed look on their face. The Grand Finale is described rather cheerily in the official Air Force history.

Japan then surrendered, still getting to keep their Emperor, and the Cold War heated up immediately. The first thing our government did at the end of fighting in Europe was hire the *Nazis*. Christopher Simpson's *Blowback* is the defining history of those events, which have serious repercussions to this day.

The [Cold War may have begun with the Russian Revolution in 1917](#). The United States sent several thousand troops to Russia to counter the Bolshevik Revolution. Communism was a threat to capitalism. The ideal of communism was share and share alike. The problem with communism, as with capitalism, is that it was not free. Capitalism is anything but free. Its coercive mechanisms are different and subtler, but it is not "free." Free markets are a myth. The [free press](#) is a myth. Workers are free to rent themselves to the capitalists, who own everything, if they want to eat and have a roof over their head. For all the spectacular failures of the Bolshevik communist system and its evils, it was still a great threat to capitalists, if the colonized people adopted it and were no longer subject to imperial exploitation. The war against Soviet communism lasted from 1918 to 1989, when the Soviet Empire collapsed.

One reason that American industrialists and politicians [embraced the fascism of Hitler and Mussolini](#) was it meant that communism would not get a foothold. Fascism was still a capitalist system, with German industrialists prominent, with heavy American investment.

After the disaster at Stalingrad in 1942-1943, many Nazis saw how the war was going to end. General Reinhard Gehlen had been planning his surrender to the Americans since the autumn of 1944, and perhaps earlier. Gehlen copied and buried the Nazi intelligence files on the Soviet Union. On May 22, 1945, Gehlen surrendered to an American Counterintelligence Corps team. Gehlen's surrender demonstrates how fractious governments are, with various groups vying for power. According to the Yalta agreements, Gehlen and his men were supposed to be turned over to the Soviets, while the Soviets were finding and returning American POWs during its advance on Berlin. In addition, many in the American military and governmental hierarchy were extremely hostile to the idea of making any deals with *any* Nazis. Gehlen, however, found himself in the middle of a power struggle in the emerging U.S. intelligence field. The CIA was not formed until 1947. At the end of World War II, there were two rival intelligence organizations, the Office of Strategic Services (OSS) and U.S. military intelligence. The OSS and military intelligence would engage in a power struggle that culminated in founding the CIA.

The United States has a tradition of civilian control of the military, and the CIA was a civilian organization, although military intelligence wanted it to be a military organization. The CIA being a civilian organization has been a double-edged sword for America and the world. On one hand, an unbridled military can lead to dictatorships rather easily. On the other hand, the military hierarchy was nearly united in its opinion to [not drop atom bombs on Japan](#). For all its great failings and dubious justification, the American military had a code of honor, of which one aspect was only killing enemy soldiers (sometimes even adhered to!), and another was that there is no honor in defeating a weak enemy. If the military had been in charge of the war effort, the atomic bombs likely would not have been dropped on Japan. The civilian leadership wanted to drop the bombs, and their opinion directed the military action. Having civilians in charge of the military can be bloodier than having soldiers running the government.

Because the CIA is a civilian organization, people such as [Ralph McGehee](#) have been able to publish memoirs of their CIA days, albeit only after [terrific struggle](#). Ralph, however, is one of a handful of CIA-critical employees who have ever published their memoirs. If they worked for the military NSA (National Security Agency), they would have never been able to publish their memoirs. I know of nobody who worked for the NSA and published memoirs that were critical of the NSA, as McGehee, Phil Agee, Victor Marchetti and John Stockwell have regarding the CIA.

Bill Donovan (known as "Wild Bill") and Allen Dulles ran the OSS, and both would later run the CIA, Donovan being its first director. Dulles ran the Secret Intelligence Branch (SIB) of the OSS. Members of Dulles' SIB that became CIA directors included Richard Helms and William

Casey. Donovan was a Wall Street lawyer, and his recruits were from Wall Street, Ivy League schools and large corporations. Fittingly, the CIA was a capitalistic organization, suited to wage war against communism. It was an Eastern Establishment organization from the outset, and the half-joke of calling the CIA the "standing Army of the *Fortune* 500" can be traced to those men who founded and ran the OSS and subsequently the CIA. Wall Street lawyer [William Nelson Cromwell](#), the man who largely [manipulated Panama into being](#), making big money for himself and his robber baron pals, chose Allen Dulles' brother John Foster to run his empire, and John Foster became Eisenhower's Secretary of State, when Allen also ran the CIA, during the McCarthy witch hunt days. During their tenure, the Dulles brothers directed the overthrow of the [Guatemalan government](#) on behalf of the corporation that brings Americans Chiquita bananas (the Dulles brothers had a [financial stake](#) in the affair), and they helped [overthrow the Iranian government](#) on behalf of the oil interests.

With the strong capitalist bent of the OSS hierarchy and American government, the communist Soviet Union was seen as the true threat to American hegemony, something evident in the comments of [Leslie Groves](#) and [James Byrnes](#). The OSS was ripe for what Gehlen had to offer: Nazi intelligence files on the Soviet Union. The Nazi intelligence-gathering program on the Soviet Union was one of history's most evil undertakings. The bulk of the intelligence was received from Soviet POWs. The Nazis intentionally murdered somewhere between three and four million Soviet POWs.[\[271\]](#) They offered the Soviet prisoners the chance to betray their people and collaborate with the Nazis. The choice was collaborate or die. The majority of Soviet prisoners chose death rather than betray their people, and they were summarily executed, starved to death, etc. They were even shipped to the death camps to go straight into the gas chambers and ovens. Those who cooperated provided the bulk of Nazi intelligence on the Soviet Union. Gehlen's greatest accomplishment during the war was designing the strategy of interrogating those POWs. After a POW told what he knew, he was often shot immediately afterward or suffered the same fate of the uncooperative prisoners. POWs that were more useful became cooks, chauffeurs and even troops that fought for the Nazis. They also, as with others in Eastern Europe, became the muscle in the extermination squads that roamed Eastern Europe, taking their part in murdering more than twenty-five million people.[\[272\]](#) The carnage of Eastern Europe under Nazi occupation has no comparable event. For sheer single-mindedness, scale and intensity, it was a slaughter unmatched in history, with the death camps only part of the scenery.

From that charnel house came Gehlen's coveted intelligence files. The OSS was soon vying with military intelligence over control of Gehlen's records. A power struggle ensued that the OSS eventually won, culminating with the CIA's formation. Gehlen and his men were hired into the American intelligence network. There were cases of Nazis working in the death camps on human experiments and going on the American payroll weeks later. When the Klaus Barbie Affair became big news in 1983, with the revelation that the United States actively protected the "Butcher of Lyons" from war crimes prosecution, it was only the tip of the iceberg. Operation Paperclip specialized in bringing Nazis secretly to America.

The space programs of the United States *and* the Soviet Union were largely built from the German scientists who were spirited out of Western Europe at the end of World War II. There was a fierce competition between the U.S. and the Soviets to get the best German scientists from the spoils of Germany, as they converged on the V-2 rocket works at Nordhausen. America got Wernher von Braun, Arthur Rudolph and Walter Dornberger from the [German V-2 program](#), men who worked with concentration camp labor, working them to death.

The dapper and aristocratic Von Braun was an SS man, hobnobbing with Heinrich Himmler, educating him about rocketry as Himmler promoted him to a major in the SS, with von Braun wearing his slick SS uniform.[\[273\]](#) Von Braun was an accomplished liar long before he became famous, and was an accomplished showman.[\[274\]](#) More than 20,000 concentration camp inmates died at the V-2 rocket works, being worked to death. They were not just Jews dying at the Dora and Nordhausen concentration camps, but expendable technically-oriented people, and a substantial number of them were Allied prisoners of war. More than 700 French political prisoners died there. Sadistic SS personnel ran the Dora camp, and even by concentration camp standards Dora was exceedingly bloodthirsty, with daily executions by hanging, machine gunning and torture. There were even turf wars over who could beat the inmates. The civilians who worked at the rocket works would beat the prisoners for fun, and after the doctor at Dora complained about it, the SS formally notified Arthur Rudolf that his people were not to beat the prisoners; only SS personnel could.[\[275\]](#)

Count Von Braun regularly visited the subterranean facility at Dora. According to one of the surviving inmates, there was an ever-growing pile of bodies that lay next to the infirmary, where the executed and tortured were thrown. Von Braun walked so close to the pile of bodies as he performed his duties that he could have practically reached out and touched it.[\[276\]](#) Even the inmates would stare at the pile in horror. Von Braun would stroll past it, seemingly unaffected. Desperately in need of prisoners with technical skills, von Braun personally handpicked inmates from the nearby Buchenwald camp to become slaves at the rocket works.[\[277\]](#)

Hitler was skeptical for years about the military potential of rockets, especially when most tests ended in failure, and spectacularly so. When they finally got a rocket to fly as it should, von Braun took that footage, combined cartoon footage with it, and produced a movie extravaganza that bowled Hitler over in 1943. According to the author of *The Nazi Rocketeers*, "Fritz Lang could not have done it better."[\[278\]](#) Hitler then gave massive support for the rocket program, to develop a weapon of "annihilation." At Dornberger's request, Hitler then bestowed a professorship on von Braun, and Hitler compared him to Alexander the Great and Napoleon.

Werner von Braun and friends were no different than all the other Nazis who tried escaping post-war retribution. For von Braun, Gehlen and gang, they sold themselves to the Americans as being useful, and instead of swinging from a noose at Nuremberg, they became American

heroes, living *very comfortably* in the United States. Those rocket scientists became key figures in the [U.S. space program](#), as did the German scientists who came under Soviet control.

The space program was the least of it. The Gehlen organization was hired nearly wholesale by America, and the Gehlen group became almost the sole source of American information about the Soviet Union for years, and that situation nearly led to World War III, as the Nazis continually lied about Soviet military capacity and intentions, and our government eagerly believed what it was told, because it wanted to believe it. It is one of the darkest chapters in American foreign policy: hiring Nazis to tell us what Soviet intentions were. The Gehlen organization greatly contributed to the arms race and Cold War, exaggerating Soviet capability and intent. The Soviet Union was not planning on invading Western Europe. They were trying to recover from a generation of bloodshed that cost forty million lives or so.[\[279\]](#) Hiring the Nazis undoubtedly helped lead to the CIA's evil policies and other U.S. security organizations, with Nazi-inspired [programs such as M-K-Ultra](#). Also, the Allies (America particularly) quickly re-armed Japanese soldiers captured in Asia, and set them to work as colonial thugs to try bringing Vietnam and China back into European/American control.[\[280\]](#)

The Aftermath in Europe

As the dust was clearing in Europe, millions of German soldiers came under Allied control. Germany had been on the losing end of two World Wars in less than a thirty-year span, and the Allies were going to make sure that they could not wage war again. France, Britain, the Soviet Union and the United States carved Germany up into spheres of influence, including the capital city of Berlin. [Henry Morgenthau](#), a Jew who ran the U.S. Treasury, developed what became known as the Morgenthau Plan, which was plainly stated in his 1945 book *Germany is our Problem*. Morgenthau proposed to de-industrialize Germany and turn it into a land of pastoral farmers. Morgenthau's plan was made a public issue in October of 1944, and the Republicans publicized Morgenthau's plan to try gaining political points on the eve of the presidential election. The Nazis used the disclosure for propaganda to its people, which probably contributed to them fighting to the bitter end in Berlin. In November of 1944, [Bill Donovan](#) wrote,

"The horrible prospects of exile to Siberia, eternal slavery, de-industrialization, breakup of Germany and even sterilization, have been carefully portrayed to the Germans by their Nazi leaders. It is considered that the German spirit of resistance has been bolstered greatly by fear of the consequence of unconditional surrender."[\[281\]](#)

Their fears were not so farfetched. All Allies extracted a measure of vengeance on the Germans, similar to the aftermath of World War I, except far more extreme. The Soviet Union nearly eliminated Germany's industrial capacity in its sphere of influence, dismantling Germany's factories and shipping them to Russia to be rebuilt. France performed similarly. France and Britain turned their German POWs into slave laborers, Britain keeping theirs until 1948. The Soviet Union brutally expelled several million Germans who lived in Eastern Europe. German POWs in Soviet hands died in vast numbers. As the Soviet Army fought its way to Berlin, the Soviet soldiers raped every German woman they could get their hands on, while often forcing their husbands to watch, and other delights.[\[282\]](#)

Roosevelt held an opinion wholly at variance with the scholarship of [William Rubinstein](#) and others. In the summer of 1944, Roosevelt wrote,

"Too many people here and in England hold the view that the German people as a whole are not responsible for what has taken place - that only a few Nazi leaders are responsible. That unfortunately is not based on fact. The German people as a whole must have it driven home to them that the whole nation has been engaged in a lawless conspiracy against the decencies of modern civilization."[\[283\]](#)

Roosevelt died before the war's end, Morgenthau's influence waned under Truman, and in April 1945, the Joint Chiefs of Staff issued JCS 1067, which was supposed to guide the denazification of Germany after the war ended. It attempted to lay an American capitalistic framework on the post-war German economy, but one that was demilitarized. How JCS 1067 was implemented, however, demonstrated how similar Nazis and Americans were. The denazification of German industry was well underway before the Americans began imposing their rule on Germany. Unfortunately for American plans, those denazifying Germany were anti-fascists. The anti-Nazis were generally left wing, labor-based groups, the same kind that formed labor unions in America and were derisively labeled "communist." In the end, United States rule suppressed that democratic movement and installed in prominent positions many of the same people who abetted Hitler's rise to power. Allen Dulles was buddies with many of the pro-Nazi industrialists, and whitewashed their bloodstained records and helped reinstall them high in German industry and banking, such as Karl Blessing.[\[284\]](#) Dulles also hired the Nazis to [staff the CIA's intelligence network in Eastern Europe](#), while protecting people such as Karl Wolff, the highest-ranking SS officer to survive the war, and who was a principal sponsor of the Treblinka extermination camp. Dulles had no problem with Nazis, as long as they were

"his" Nazis.

James Bacque, a Canadian, published *Other Losses* in 1989. Bacque made the case that after the European war ended, about one million German soldiers died in the Allied prison camps. Bacque claimed that Allied leaders largely induced the deaths of those German soldiers, intentionally. Bacque took particular aim at Dwight Eisenhower, who came to hate the Germans as he witnessed the destruction of Europe and the opening of the death camps. Bacque's most ardent critic has been Stephen Ambrose, Eisenhower's biographer and the director of the Eisenhower Center at the University of New Orleans. Ambrose, although he initially hailed Bacque's work, later denounced it and edited a book to rebut Bacque's thesis in *Eisenhower and the German POWs, Facts against Falsehood* in 1992. Bacque's research and arithmetic is questionable, although Ambrose is the epitome of an establishment historian. Bacque responded with *Crimes and Mercies* in 1997, digging into the newly available Soviet archives to further bolster his case. Bacque also made the case that up to ten million Germans died under Allied occupation between 1945 and 1950, largely from starvation.

Regarding the Bacque and Ambrose imbroglio, Michael Adams wrote,

"The truth is probably somewhere in the middle...One wrote, 'I witnessed the atrocities that Stephen E. Ambrose tried to deny or gloss over'...As another American guard admitted, 'we sometimes slipped over the boundary of civilized behavior and resembled what we were fighting against.'" [\[285\]](#)

Zora Neale Hurston wrote after World War II,

"I am amazed at the complacency of the Negro press and public. Truman is a monster. I can think of him as nothing else but the Butcher of Asia. Of his grin of triumph on giving the order to drop the Atom bombs on Japan. Of maintaining troops in China who are shooting the starving Chinese for stealing a handful of food." [\[286\]](#)

When establishment historians defend American soldiers and others, as if we are saints in our foreign policy, our noble boys going abroad to "defend freedom" and "fight for our country," [I am reminded of the experiences told me by Vietnam veterans](#), both first hand and [second](#)

[hand](#). The viciousness that [Eugene Sledge](#) recounted in his memoirs is typical in World War II accounts. Paul Fussell wrote how his men shot a group of twenty German soldiers, huddling in a crater, "most in tears of terror or despair" as the Americans came upon them. For no reason at all, the Americans opened fire on the surrendering and quite helpless Germans. Fussell called it the Great Turkey Shoot, writing,

"Laughing and howling, hoo-ha-ing and cowboy and good-old-boy yelling, our men exultantly shot into the crater until every single man down there was dead. A few tried to scale the sides, but there was no escape. If a body twitched or moved at all, it was shot again. The result was deep satisfaction, and the event was transformed into amusing narrative, told and retold over campfires all that winter. If it made you sick, you were not supposed to indicate. I was beginning to understand what a marine sergeant told Philip Caputo during the Vietnam War: 'Before you leave here, Sir, you're going to find out that one of the most brutal things in the world is your [average nineteen-year-old American boy](#).'"[287]

Noam Chomsky admitted that the facts surrounding Bacque's thesis are debatable, but,

"On the other hand, there are things about which there's no controversy. Ed Herman and I wrote about them back in the late 1970s. Basically, the Americans ran what were called "re-education camps" for German POWs (the name was ultimately changed to something equally Orwellian). These camps were hailed as a tremendous example of our humanitarianism, because we were teaching the prisoners democratic ways (in other words, we were indoctrinating them into accepting our beliefs).

"The prisoners were treated very brutally, starved, etc. Since these camps were in gross violation of international conventions, they were kept secret. We were afraid that the Germans might retaliate and treat American prisoners the same way.

"Furthermore, the camps continued after the war; I forget for how long, but I think the US kept German POWs until mid-1946. They were used for forced labor, beaten and killed. It was even worse in England. They kept their German POWs until mid-1948. It was all totally illegal.

"Finally, there was public reaction in Britain. The person who started it off was Peggy Duff, a marvelous woman who died a couple of years ago. She was later one of the leading figures in the CND (the Campaign for Nuclear Disarmament) and the international peace movement during the 1960s and 1970s, but she started off her career with a protest against the treatment

of German POWs.

"Incidentally, why only German POWs? What about the Italians? Germany's a very efficient country, so they've published volumes of documents on what happened to their POWs. But Italy's sort of laid back, so there was no research on their POWs. We don't know anything about them, although they were surely treated much worse.

"When I was a kid, there was a POW camp right next to my high school. There were conflicts among the students over the issue of taunting the prisoners. The students couldn't physically attack the prisoners, because they were behind a barrier, but they threw things at them and taunted them. There were a group of us who thought this was horrifying and objected to it, but there weren't many."[\[288\]](#)

Chomsky has stated that the first chapter in an honest history of the aftermath of World War II would be about how food was used as a political weapon. It is true that many Americans were in favor of feeding and helping out the people of Europe (much less so for those hated, non-white Japs), and the generous spirit of the average American is to be commended in that instance, yet their politicians all-too-often used the Marshall Plan and other help for political leverage.

The aftermath of World War II was in some ways a turning point for humanity: the next World War would extinguish humanity. Another total war would mean the total extermination of the human race. The United States had the early lead in atomic weapon development, but the Soviet Union, Britain, Canada and France were not far behind. The next war would annihilate the species, taking the planet with it. That sobering realization hit all parties. Probably the only thing that kept another World War from happening was that the concept of MAD, Mutually Assured Destruction, was understood.

Nevertheless, the people who run America's military establishment had the idea they could win a nuclear war. John Foster Dulles, Eisenhower's Secretary of State, had a concept of diplomacy that gave rise to *Dr. Strangelove* and other works of art. Dulles threatened the Soviet Union with nuclear attack as his style of diplomacy. Dulles' style became known as "brinksmanship."

In 1949, the Soviet Union exploded its first nuclear weapon, and the two powers began an arms race that saw them build enough nuclear weapons to incinerate earth's entire surface many times over. Also In 1949, the United States had a plan to attack the Soviet Union with atomic weapons. The plan was to deliver about seventy nuclear weapons onto the Soviet Union over a thirty-day period, which would destroy about 40% of the Soviet Union's industrial capacity. The Joint Chiefs of Staff realized, however, that dropping seventy nuclear bombs

onto the Soviet Union would not be enough to assure victory. They realized that they would also need ground troops, and the members of the infamous Bloodstone program (staffed with Nazis and Nazi-collaborators that the United States hired after World War II was over) would engage in completing the American victory over the Soviet Union. The Bloodstone mercenaries were to be flown to the glowing ruins of the Soviet Union to complete the job. A major aspect of the plan was to foment an uprising of the Soviet people against the Stalin regime. Christopher Simpson wrote,

"The thirty day atomic assault, the Pentagon concluded with considerable understatement, 'might stimulate resentment against the United States' among the people of the USSR, thus increasing their will to fight."[\[289\]](#)

In November of 1997, Bill Clinton issued a Presidential Decision Directive that authorized the U. S. military's use of nuclear weapons on nations that may have weapons of "mass destruction."[\[290\]](#)

The Third World War and the Modern War Racket

Cooler heads prevailed regarding those [Stangelovian plans of 1949](#). It soon became evident that such events would bring the annihilation of the human species, and the few survivors might wish they were dead. It became evident that the imperial nations could no longer wage open war against each other. So, logically, America reverted to neocolonial warfare against the world's colored people, hence Korea, [Vietnam](#), [Iraq](#), [Panama](#), etc. [Since World War II](#), American has always picked on nations that could not fight back, and no atomic weapons they could retaliate with. American war planners considered dropping atomic bombs on Vietnam, and [Cal Thomas](#) and friends openly argued for dropping atomic bombs on Iraq during the Gulf War Turkey Shoot. In the name of making sure that Iraq never acquires the kinds of weapons that we have, America has killed [more than one million Iraqi citizens since 1991](#), about half of them children.

Astute commentators from across America's political spectrum call the U.S. war against the world's poor the [Third World War](#). When the lies and rhetoric are stripped away, it is obviously a continuation, with slight variation, of the age-old imperial game, with the U.S. elbowing the other imperial players out of the way. With the collapse of its empire after World War II, Great Britain has been a relatively impoverished nation, and has been trying to ride the U.S.' coattails

since the Cold War ended, helping out with [bludgeoning Iraq](#) and carrying the U.S.' bags during its "[war on terror](#)."

Cold War rhetoric and disinformation largely obscured the colonial aspect of the postwar years, at least from the American people. During the Cold War, the more fortunate Third World nations, generally those who had something the West coveted and had relative cultural sophistication, were able to play the capitalist and communist powers off against each other, to a degree. However, when the Berlin Wall fell, marking the end of the Soviet Empire, America quickly showed the world what the global dynamics really were; [America invaded Panama](#) a couple of weeks after the Berlin Wall fell, concocting rationales so transparently ridiculous they should have been considered jokes, except that the American invasion killed thousands of Panamanian civilians. With the Soviet Union out of the picture, the U.S. quickly found an excuse to establish a military presence in the oil-rich Middle East, something it largely could not do before. The United States may well have [baited Iraq into invading Kuwait](#). If not, Iraq's invasion of Kuwait was a convenient excuse for America to flex its muscles in the Middle East, and its ongoing genocide in Iraq and military presence in Saudi Arabia were possibly the [two largest factors](#) behind the [World Trade Center](#) attacks of 2001. Saudi Arabia contains the holiest sites of Islam, and Osama bin Laden was particularly dismayed when Arabia's rulers allowed a U.S. military presence there. As I am writing this, the United States is once again preparing to [invade the Middle East](#), allegedly to remove Saddam Hussein from power, and Saudi Arabia has made it clear that it will not allow the United States to use its nation as a staging ground, as it did in 1990-1991. [\[291\]](#)

The United States has been throwing around its weight since the Cold War ended with predictable impunity (the U.S. is called a "hyper-power" in France), and just as predictable were the [World Trade Center and Pentagon attacks of 2001](#): the global Godzilla finally got punched in the nose. Just as the "[war on drugs](#)," "[war on cancer](#)," "war on communism" and other phony wars, the "War on Terror" is the new rubric under which the world's people have been subjected. In [Colombia](#), many thousands of peasants were slaughtered as part of the war on communism, those peasants being called Soviet pawns. When the Soviet Union collapsed, the same groups of people (Colombian government military and paramilitary) killed the same peasants, but then the killings were part of the "war on drugs." During the summer of 2002, Bill Clinton called the government military effort in Colombia part of the war on terror. How can anybody take the rhetoric seriously, with the same peasants being communists one day, drug growers and dealers the next, and now terrorists? When one phony term wears out, our "leaders" just make up another.

Numerous foreign relations scandals hatched during the past generation, the most notorious being the Iran-Contra Scandal. Although the U.S. government did its best to cover-up what happened, enough came into the open to see how the game was played. The U.S. was selling arms to Iran and the Contras, and airplanes were flying to the Nicaraguan Contras with arms,

and flying back with drugs, drug sales being a [longtime favorite method to finance covert action](#).^[292] The Iran-Contra Scandal was directly related to the [Savings and Loan Scandal](#), as the CIA used savings and loan institutions to launder drug money. The Iran-Contra Scandal was an embarrassment, with government officials dragged onto the witness stand, with document-shredding parties coming into the open and other activities. Accordingly, U.S. covert action has been getting more privatized ever since, especially since the Cold War ended.^[293] The U.S. began [privatizing covert action](#) after the 1953 overthrow of the Iranian government. If private individuals and organizations do the dirty work, instead of operating out of the White House as Oliver North did, the likelihood of government officials being subpoenaed and airing out the government's dirty laundry is minimized. The privatization effort is a new tactic to avoid public accountability and create more plausible denial, which naturally further shreds the U.S. Constitution, with U.S. wars being planned and carried out by mercenaries and those who employ them.

The racketeering aspect of warfare has been long with us. [Smedley Butler](#) wrote [War is a Racket](#) before World War II and the rise of today's military-industrial complex. Dwight Eisenhower stated,

"People in the long run are going to do more to promote peace than our government...One of these days government had better get out of their way and let them have it."

and

"...Every gun that is made, every warship launched, every rocket fired, signifies in the final sense a theft from those who hunger and are not fed, those who are cold and are not clothed."

Being a U.S. arms manufacturer is one of the world's most lucrative deals, and [they can be quite ruthless](#). After World War II, the lucrative aspect of the military-industrial complex, which Eisenhower warned against when he left office as president, became big business.

America's national debt is mainly due to the war industry, a national debt that is measured in trillions of dollars. It is well known that trying to keep up with America in the arms race, a race that the U.S. always instigated, not the Soviets, largely bankrupted the Soviet Empire. It was

even admitted by Reagan and his [policy-makers](#). Trillions of dollars went into arming both sides to the teeth, and the only winners were the arms manufacturers and the imperial exploiters. Today, the United States is the leading international arms dealer, and has been so for many years. America's "foreign aid" is generally in arms sales. Far more money is spent on arms internationally (about twenty times as much.) than is spent on [helping the poor and hungry](#). Other side effects are the widespread environmental devastation that the war industry inflicts on the world, even when they are not fighting wars.[\[294\]](#) The war industry is probably the most costly and unnecessary undertaking on earth today, especially if [World War III](#) exterminates the human species.

The "defense" industry in the United States has raked in trillions of dollars during the past fifty years (one authoritative estimate puts it at nearly twenty trillion dollars[\[295\]](#)). When the Cold War ended, there literally were no more enemies worth worrying about. Once the "Soviet Menace" evaporated, the defense establishment searched high and low to find enemies to keep justifying the pork barrel. Muammar Qaddafi, Manuel Noriega, Saddam Hussein, drug dealers, Castro, etc., had to be magically transformed into malevolent demons that threatened America's very existence. America has the biggest killing machine the world has ever seen, and no military rivals. The [Gulf War](#) and pounding [Yugoslavia](#) were excuses to test weapons and increase America's hegemony. The war racket is related to the government racket. [Ronald Reagan](#) told tall tales about welfare mothers driving Cadillacs, while he threw mentally ill people onto the streets. There is a small book that summarizes all the ways that the American public is bilked to buy Cadillacs *for the rich*, not the welfare mothers.[\[296\]](#)

The [Savings and Loan Scandal](#) lined the pockets of the rich to the tune of hundreds of billions of dollars at the taxpayer's expense. It was a scandal that my CPA profession actively abetted, taking in its huge audit fees for signing off on fictitious financial statements. The authors of *Take the Rich off Welfare* summarize the many ways that the rich get handouts from the American government, such as: social security tax inequities, accelerated depreciation, capital gains deductions, homeowner's tax breaks, agribusiness subsidies, aviation subsidies, insurance loopholes, tax free bonds, timber subsidies, oil and gas tax breaks, nuclear subsidies, etc. They are laws that primarily benefit the wealthy. The rationale is that they are subsidies that benefit the economic producers, giving them incentives or help to make the economy more productive. The [media](#), being owned by those corporate welfare recipients, rarely highlights the real welfare. When I was a [tax accountant](#), I saw the scam in action. Politicians write laws that benefit their constituencies, which are the rich people who bankroll their campaigns and basically own them. The accounting in *Take the Rich off Welfare* is conservative, as the authors add up all the boondoggles that rip off the American taxpayer to benefit the rich. The biggest single category of rip off is what the authors call "military waste and fraud." The waste and fraud are for weapons systems that nobody in the military wants, but billions are still spent for them, and other outrages. The authors summarized some of the defense contractors' pricing schemes:

1. A nut that can be bought at a hardware store for a few cents that McDonnell Douglas charged \$2,043 for;
2. A pair of pliers that Boeing tried charging \$2,548 for, but the Air Force *slashed* the price to \$748;
3. The famous toilet seat that Lockheed charged "only" \$640 for;
4. A \$240 flashlight from Grimes Manufacturing;
5. The authors' favorite was a plastic cap that goes over the end of a stool leg, that Boeing charged \$1,118 each for. [\[297\]](#)

That barely scratches the surface of the waste and fraud that is a daily part of America's military-industrial establishment. Billions of dollars in military equipment simply "disappears" every year. There are many weapons systems that cannot be justified by the most fervent imagination, especially with the Soviet Empire gone, but America keeps upgrading nuclear missiles, transport planes, jet fighters, submarines and the like to the tune of tens of billions of dollars. Some items, such as the Seawolf submarine, the Navy itself says that it does not need or want it, but they are getting one for a few billion dollars. There is the Black Budget, the totally unaccountable budget of about \$30 billion a year to fund the NSA and other spook agencies. If Americans found out [what really happened in the spook world](#), it would curl their hair. I have had friends who worked in that world, and it can be sickening and nearly beyond belief at times.

The authors of *Take the Rich off Welfare* conservatively calculate how much of the military expenditures are a complete waste of money, and arrive at \$172 billion a year. When they add up merely the major categories of welfare for the rich, their *conservative* calculation is that it costs America at least \$448 billion a year, money that lines the pockets of the rich for no perceived public benefit. That is partly how the rich get richer. The authors then calculate how much public money goes to serving the needs of the poor in America. The number is about \$130 billion. [\[298\]](#) In the end, the American government is a mechanism that makes the rich richer, taxes the middle class, and throws some crumbs to the poor who do the work.

I have professional friends who have [tried justifying](#) why poor Mexicans pick America's food and make its clothes, why poor Indonesians and Filipinos [staff luxury cruise ships](#) and make [America's tennis shoes](#), why black Americans work in the most wretched factories in the worst jobs, and the like, as if it was the natural order of things, with them at the top of the heap due to their unique virtue. Then they say that we are trying to help Indonesia by putting our shoe factories there, to get them "capital." They read the *Wall Street Journal* too much.

The war racket makes huge sums of money for certain people, while others die horrible deaths or live in unspeakable misery. There are persuasive arguments that the same interests arm both sides in the wars, not really caring much who wins, just as long as everybody "plays."^[299] The Soviet and [German war machines](#) in World War II were partly built, some say largely built, by American industrialists. Chomsky's *Year 501, the Conquest Continues*, looks at this 500-year period of European dominance of the world from another, non-conspiratorial, perspective. C. Wright Mills' *The Power Elite* looked at the post-war evolution of the power structure that runs America today, and Mills endured great grief for daring to publish his book.

There is another facet of the war racket, and perhaps the most important of all. Those behind the scenes, pulling the strings, [truly enjoy all the death and suffering that war creates](#). That may be their biggest payoff, watching all the death and suffering they manipulate into being, and it nourishes them, literally. Healing our hearts is the great task before us, and time is short.

Peace

^[2] I trained for the testing. My weak point in the testing regimen was pull-ups, so I did them daily and got up to twelve at a time, which would have been plenty to pass their standard. One test was throwing and another was jumping. I was a high jumper and long jumper in high school, and a javelin thrower and high jumper in college. The athletics testing would have been no barrier.

[29] See Loewen, *Lies my Teacher Told Me*, p. 167 for a picture of a lynch mob proudly posing next to a burning black man. In the foreground of the crowd is a woman who appeared dressed for a night on the town. The reason for such bold and murderous lawlessness was that the killers knew that no white jury would ever convict them of murder, even with a picture of them proudly posing beside their prey. The recent book [*Without Sanctuary: Lynching Photography in America*](#), shows how common, even festive, American lynchings were, not so long ago. Loewen had a history book of his rejected partly because of that photo by the Mississippi State Textbook Board. During the 1864 Democratic campaign, in their songbook was a song sung to the tune of Yankee Doodle Dandy. The song was one of the favorites of that campaign year, a year when a war was going on to supposedly free the slaves. The song was titled "Nigger Doodle Dandy." Here is one verse: "Blubber lips are killing sweet, and kinky heads are splendid; and oh, it makes such bully feet to have the heels extended." Then the Chorus: "Nigger Doodle's all the go, Ebony shins and bandy, "loyal" people must all bow to Nigger Doodle Dandy." See Loewen, *Lies my Teacher Told Me*, p. 155. Loewen would ask his history classes to sing along with him, singing the words of those noble democrats. The people would be so shocked by the words that they sat in stupefied silence.

[109] For discussions of those and other practices, with a number of them surviving to the present day, read Ward Churchill's *Since Predator Came*, *Struggle for the Land*, and *A Little Matter of Genocide*. If you want to read about such current American practices from a white man, read Rex Weyler's *Blood of the Land*.

[110] See Churchill, *Since Predator Came*, p. 34.

[111] See *The American Almanac*, 1996-1997, table 118.

[112] See Simon, *The State of Humanity*, p. 183. See also the *American Almanac's* various tables. For a dramatic and unanswerable depiction of that income stagnation among blacks, see table 717. In 1970, black family income was 61% of white income. In 1994, it had *declined* to 60%. Not only that, 1994 was a "good year" for blacks as it reversed the trend that saw 1993 family income actually *lower* than 1970 family income, in constant dollars.

[113] In 1989, in constant dollars, native, black and Hispanic family incomes were all comparable, at about 60% of the white income, with the Hispanic population having a slight edge. A problem with "Hispanic" however, is that it is not a racial distinction as black and native are, and many in the Hispanic category are white people, such as the ruling classes of Latin America. If the "Hispanic" population was broken down into categories such as "primarily European descent" and "primarily

native descent," there would be two very distinct populations. Members of the white ruling class of Latin America are not to be found in the "Hispanics" who pick America's produce. I do not know if such data has even been collected, but it would evidence two distinct strata, with the "native Hispanics" having a lower income level than the "average" Hispanic. My wife is Hispanic, but is about the furthest thing that one can imagine from a bean picker. Her family hails from Spain, and has lived in New Mexico for centuries with land "granted" to them from the Spanish Crown. They are ruling class Hispanics who own vast ranches, not those who pick our beans. The native tribes show great variation in income levels. The "civilized" Cherokee and Iroquois tribes do very "well," at around 60% of white income. Other tribes that have resisted assimilation and are more confined to their reservations, such as the Sioux and Navajo, have income levels as low as 30% of white income. They are also the natives with such low life expectancies. See *The American Almanac*, 1996-1997, table 52.

[114] Still, America's literati were not always happy with Costner's far more honest depiction of native life before the white man, and they engaged in attacks on the movie. See Churchill's *Indians are Us?*, pp. 115-137.

[115] See Ward Churchill's *A Little Matter of Genocide*, pp. 363-398.

[116] As Chomsky, [Herman](#) and others make quite plain, "national interest" is a code word for "corporate interest." America does not send troops to defend and promote democracy, but to defend its grip on cheap labor and resources, to keep the chips flowing the corporate way, and their customers'. Yet, the customer benefit is in some ways an unintended byproduct. The Holy Grail of corporations is profits, not a well-served public, which is the whole point of my [racketeering for fun and profit](#) thrust.

[117] I have discovered a "myth-debunking" stance, which seems more like establishment apologetics, in several areas during my research for this site, including the Inquisition, the career of George Custer, health and medicine.

[118] See, for instance, Verne Newton's *FDR and the Holocaust*. Just as all the responsibility for the Jewish Holocaust should not be heaped on Hitler's shoulders, FDR should not be held mainly accountable for the United States' reaction while the Jewish Holocaust was coming and being carried out. In both instances, proponents of the "culpability" theory subscribe to the "Great Man" view of history.

[119] See Rubinstein, *The Myth of Rescue*, p. 33.

[120] See Rubinstein, *The Myth of Rescue*, tables 5, 6 and 7 on page 49.

[121] See Stannard, *American Holocaust*, p. 133.

[122] See Rubinstein, *The Myth of Rescue*, p. 20.

[123] See Rubinstein, *The Myth of Rescue*, p. 18, table 1.

[124] See Rubinstein, *The Myth of Rescue*, p. 39.

[125] See Lipstadt, *Beyond Belief*, pp. 112-114.

[126] See Dinnerstein, *Anti-Semitism in America*, p. 143. See also the excellent documentary *America and the Holocaust, Deceit and Indifference*, made for PBS by the *American Experience* series.

[127] Yahil, *The Holocaust*, p. 119.

[128] See Lipstadt, *Beyond Belief*, p. 117.

[129] Hilberg, *Perpetrators, Victims, Bystanders*, p. 257.

[130] See Thomas and Morgan-Witts, *Voyage of the Damned*, p. 183.

[131] See Rubinstein, *The Myth of Rescue*, p. 228.

[138] See Bard, *Forgotten Victims*, pp. 19-20.

[139] See Bard, *Forgotten Victims*, p. 25.

[140] See Bard, *Forgotten Victims*, pp. 57-58.

[141] See Bard, *Forgotten Victims*, p. 67.

[142] *Forgotten Victims* has photographs of those surviving American soldiers, who look just like the Jews who were liberated from the death camps.

[143] Regarding that situation and others like it, see Dinnerstein's *Anti-Semitism in America*, chapters 6 and 7.

[144] See Rubinstein, *The Myth of Rescue*, p. 158.

[145] See Rubinstein, *The Myth of Rescue*, pp. 158-164.

[146] James H. Kitchens III, "The Bombing of Auschwitz Reexamined," Originally in *The Journal of Military History* (April 1994), pp. 233-66. Reproduced in Newton's *FDR and the Holocaust*, pp. 183-217. Levy's argument is reproduced in *FDR and the Holocaust*, pp. 219-272.

[147] Stuart G. Erdheim, "Could the Allies Have Bombed Auschwitz-Birkenau?" *Holocaust and Genocide Studies*, (Fall 1997), pp. 129-170.

[148] See Herzstein, "Is It Time to Stop Asking Why the West Failed to Save More Jews?" *Holocaust and Genocide Studies*, Fall 1998, p. 335.

[149] See Rubinstein, *The Myth of Rescue*, p. 216.

[150] For instance, Howard Zinn makes a compelling case for the head-on-a-platter aspect of the Watergate scandal, where Nixon and his cronies were publicly crucified, while the system that created the Nixons were left intact and not questioned. See Zinn, *A People's History of the United States*, pp. 529-569.

[151] See Herzstein, "Is It Time to Stop Asking Why the West Failed to Save More Jews?" *Holocaust and Genocide Studies*, Fall 1998, pp. 326-338.

[152] Hilberg, *Perpetrators, Victims, Bystanders*, p. 249.

[153] See Aly, *Final Solution*, pp. 195-197.

[154] For instance, see the map and numbers presented in Altshuler and Dawidowicz's *Hitler's War Against the Jews*, immediately after the book's introduction, for typical estimates of the fate of European Jews, which are faithful to the historical evidence. See the table on p. 197 of Götz Aly's *Final Solution*, for a detail of Jews that came under Nazi control leading up to the Final Solution, which tabulated more than eleven million Jews subject to the Final Solution, as compared to Harwood's three million.

[155] See Churchill, *A Little Matter of Genocide*, p. 19.

[156] See, for instance, Norman Finkelstein's *The Holocaust Industry*, pp. 81-83.

[157] On Holocaust Denial, among my sources are Andrew Carter's *The Facts - and the Myths - about the Holocaust*, Richard Harwood's *Did Six Million Really Die?*, Kenneth Stern's *Holocaust Denial*, and Deborah Lipstadt's *Denying the Holocaust*. Also, there is plenty of material on the Internet devoted to the issues both pro and con, such as transcripts from the Canadian trials of Ernest Zündel, a Holocaust denier.

[158] See Lipstadt, *Denying the Holocaust*, pp. 209-222.

[159] See Finkelstein's *The Holocaust Industry*, which Raul Hilberg says is "going in the right direction."

[160] Gypsies prefer to call themselves the Romani and Sinti people. I use "Gypsy" in this narrative for the sake of convention. Like it or not, people have become known as "white, Indian, Gypsy, Jew" and other names, names that they may not always like hearing. I have tried using names for those groups that are not offensive but are also generally recognized.

[161] See Churchill, *A Little Matter of Genocide*, pp. 36-53.

[162] For instance, see Gérard Chaliand and Jean-Pierre Rageau's *The Penguin Atlas of the Diasporas*, p. 109, for a summary of the world estimate of the Gypsy population, which ranges between eight and fifteen million people.

[163] See Churchill, *A Little Matter of Genocide*, pp. 48-49.

[164] See Churchill, *A Little Matter of Genocide*, p. 42.

[165] Ward Churchill makes the very compelling case for that opinion in his *A Little Matter of Genocide*, pp. 19-62.

[166] See Blum, *Killing Hope*, p. 1.

[167] See Stern, *Holocaust Denial*, p. 94.

[168] See Stern *Holocaust Denial*, pp. 53-54 and notes 125 and 126, on pp. 172-172. What Chomsky has *always* done regarding the Cambodian genocide is to [demonstrate the hypocrisy regarding how the American media handled it](#). Chomsky compared it to the mass slaughters in Indonesia and East Timor, for instance. The Cambodian genocide was partly an American media fabrication, and the first major killings in Cambodia the United States performed (at least a half million killed), a fact

unmentioned in the drumbeat of "genocide" that dominated the American press. When it later turned out that Pol Pot's "nationalistic" project was indeed genocidal, the U.S. press was accidentally correct. See Chomsky and Herman, *The Washington Connection and Third World Fascism*, pp. 19-22. See Chomsky and Herman, *After the Cataclysm*, pp. 135-294. See Chomsky, *The Chomsky Reader*, pp. 289-297. See Herman and Chomsky, *Manufacturing Consent*, pp. 260-296. Regarding the Faurisson affair, see the documentary *Manufacturing Consent*. See also Rai, *Chomsky's Politics*, pp. 131-132, 201-202.

[169] See Stern, *Holocaust Denial*, p. 55.

[170] To be fair, some in the American press covered for Stalin at the height of his genocidal purges, such as Walter Duranty of the *New York Times*. See Taylor, *Stalin's Apologist*.

[171] See Adams, *The Best War Ever*, p. 42.

[172] See Zezima's Saving Private Power, pp. 79-86. See Vankin and Whalen, *50 Greatest Conspiracies of All Time*, pp. 259-262. See The National Insecurity Council, *It's a Conspiracy!*, pp. 9-13.

[286] See Zinn, *Declarations of Independence*, p. 100.

[287] See Fussell, *Doing Battle*, p. 124. As an anecdote regarding such brutality, one interrogation tactic of our boys in Vietnam was taking a bunch of prisoners up in a helicopter, and when one would not talk, they would throw him out of it, seeing if it might loosen the lips of the prisoners who witnessed that act. That "helicopter therapy" was the least of it. One close relative of mine knew a man who

specialized in that brand of interrogation. Throwing them out of the helicopter to their deaths was easy and unimaginative. My relative's buddy specialized in the high art of interrogation. He manned one of those machine guns that were mounted on those helicopters. They would throw out a hapless prisoner, but he would not fall to his death. My relative's buddy would shoot the prisoner with his machine-gun, while the prisoner was in mid-air. It was macabre skeet shooting. He could keep the prisoner aloft with the force of the bullets hitting his body. The bullets' force overcame gravity, keeping the body in the air. He could keep a body in the air for quite some time. With each shot the body would move further away from the helicopter, and spin with the force of the bullets hitting it. In a successful episode, the body would stay in the air until the bullets began disintegrating the body.

Introduction

America's three most wasteful and useless industries are probably [energy](#), [medicine](#) and [war](#); all three barely deserve to exist, if at all, although they comprise about a third of the American economy in retail dollars, and perhaps more than half of the economy, when costs are considered that the market does not measure, such as environmental devastation, [interest on the national debt](#) (as well as the debt itself), infrastructure costs and so forth. Also, the impossible-to-calculate cost in human suffering is at awesome levels in all three industries. The situations painted in this site's relevant essays argue in

support of [the thesis](#) that the larger, more powerful and more monopolistic any industry or profession becomes, the more it degenerates into a racket, eventually becoming a dinosaur that only stays alive because it has hogged all the nearby fodder and kills anything that comes near. Also, because the United States is largely [a nation of brainwashed people](#), the idea that people *need* those industries has been deeply ingrained.

Although those three industries may be the starkest examples of racketeering in business, they are by no means the only industries that are worthless, or garner a far greater share of America's economic pie than is fair. In [medicine](#), professionals and industries have combined to create a medical-industrial complex. Other industries and professions also complement the big three rackets, and help form American society's power structure. This essay will present other industries and professions that are corrupted, greatly inflated or simply worthless. Some could simply fade away to the oblivion they deserve, while others deserve a far smaller stature than they currently enjoy.

Areas of American life that are filled with death, dying, suffering and misery are also where the big money is made. [American doctors](#) and [lawyers](#) are the earth's two most highly paid professional groups, and there is about zero societal benefit derived from their efforts. The war industry has always been [incredibly lucrative](#) for weapons suppliers, and usually for the "winners," who were not the soldiers. [Tobacco companies](#) have been immensely profitable. In terms of profits as a percent of sales, the [pharmaceutical business](#) is America's most lucrative. The industries that have relentlessly raped the land, mining and forestry in particular, have always done great while the mines and forests lasted, leaving behind devastated landscapes when the dust settled.

The recent trend to privatize the prison system in America is ominous, particularly when corporations are putting factories in the prisons, paying the inmates wages below the minimum wage, as they work for such companies as Microsoft (controlled by the world's richest man), in what is effectively a new era of slave labor, where the labor force is in the strongest sense, captive.^[1] There is being created an economic incentive to put people in prison, only different by degree from the [concentration camp labor situation](#) of Nazi Germany during World War II. The journalist-turned-professor Nathan McCall spent years in prison when he was younger, and a memorable, ironic moment was when he worked on the prison farm. There was a black man in the South, down on all fours, picking vegetables, while nearby was the ever-present "white, shotgun-toting prison guard." McCall thought about the lives of his ancestors, wondering if it looked the same during slavery.^[2]

With the world's largest prison population, bringing capitalism to the American prison industry is creating an incentive to lock up more people, because the more prisoners there are, the more money is made. There is increasingly no pretense of "protecting" the public (or even rehabilitation), as most inmates are in there for drug "crimes." All law enforcement agencies across America, including the judges, [have their hands in the drug trade to some degree](#) (I know it went on in [Ventura County](#)), as it is highly lucrative, which makes the entire imprisoning apparatus appear hypocritical, as judges and sheriffs lock up their customers, although judges and law enforcement operate more on the wholesale level, as they lock up the retail customers, making money going and coming.

The industries and professions this essay examines have varying levels of racketeering in them; some

are *relatively* benign, while others are more malignant.

The Life Insurance Racket

The case can be made to nearly entirely eliminate the life insurance industry. Life insurance, as with all insurance, is supposed to be a way to “spread the risk” of living on earth.

It is a good and compassionate idea to design a system that can provide for each other as the disasters of life befall us. Death can come at any time, although in our civilized world, deaths before “old age” are increasingly rare. During our lives, people can come to depend on us at times, particularly our children. In tribal life and the extended families before our modern age, the child was not in a “nuclear” family, so the issue of premature parental death was not as big as today.

A system to spread risk should be simple. In life insurance, for instance, death rates by age group and other trends are easy to come by, requiring no great skill. Spreading the risk of an untimely death is easy. There can be arguments on how to do it equitably, and a national tax that all income-earners would pay into, with benefits mildly graduated along income levels and financial dependents, the dependents’ ages and the age of the earner, is a possibility. Arguments can be made about adjustments for smokers, construction workers, number of dependents, et cetera, but those are minor strategic arguments, not fundamental ones. Somebody sixty-five years old generally will not have anybody depending on his/her earnings for the subsequent twenty years, as a twenty-five-year-old father would. Who would not want their dependents somehow provided for if they die before their time? Administering the income and payments would be elementary. In life insurance, there is little need for claims adjusters and the adversarial nature that all-too-often typifies other types of insurance, pitting claimant against insurer. Death is not a debatable condition. Similar logic could be applied to all areas of insurance, such as casualty, medical, et cetera. That is not how it operates in our capitalistic world, however.

The first life insurance policy on record was written in London on June 18, 1536, a one-year policy on the life of William Gybbons. Gybbons died on May 29, 1537, run over by a hit-and-run bullock cart. In a telling beginning to the industry and a comment on insurance in general, the company refused to pay the widow and children of Gybbons, insisting that a year consisted of twelve months of four weeks each, making Gybbons’ unfortunate death a few days outside of the policy period. The widow took the insurers to court and won, as the insurers’ logic was rejected.[\[3\]](#)

In the early 1800s in America, during the industry’s early days, “term insurance” was the only kind there was. The policy was as simple as it sounds. It insured against a person’s death for a specified time. Because America was far from any socialistic (i.e., taking care of each other) leanings then, insuring one’s life was a strictly commercial affair. The problem was that with term insurance, the risk of death was greater as the policyholder aged, so premiums increased over time. The people who tended to get the insurance were relatively unhealthy or had others risks of untimely death. [Wives of surgeons were uninsurable in those days](#), for instance. The risk was not being spread around, and insurance companies got bankrupted; the industry’s survival was in question.

In response to that problem, a two-fold ploy was invented, and is today called “whole life.” Whole life’s premiums did not escalate with age, and there was a “savings” portion put into the policy benefit, meaning that insurance companies became bankers. The simple idea of insuring one’s life then became complicated. There are arguments that the change was necessary if the industry was going to survive, but instead of creating a safety net for the masses, life insurance became a tremendous scam. By 1900, the industry was as corrupt as all the other robber baron industries, which prompted a New York State investigation in 1905 called the Armstrong Joint Legislative Inquiry, which unearthed many grim activities. America’s “faith” in the industry evaporated, and it took a combination of some minor reforms and a lot of public relations to make life insurance “respectable” many years later. Yet, its “respectability” is not really earned.

In the 1994 *Consumer Reports Life Insurance Handbook*, the state of the life insurance industry was summarized (I have not looked into this situation for several years, but doubt that much has changed). The book called for reforming the industry, citing virtually no price competition between the companies, no effective regulation from state insurance commissioners (who more often act as advocates of the life insurance companies than the life insurance customer - the [regulator was captured](#)), and a dearth of honest sales tactics, where lying and scam policies, particularly directed at the elderly, were rampant.

Anybody who puts their money into a savings account at a bank knows their rate of interest. With whole life, the customer does not know. The insurance companies merged the life insurance and savings portions of their policies, and the policyholders never knew what their “return on investment” was. With whole life policies, the rate of return can be negative, and has been, but the policyholder never knows. The life insurance industry was able to get away with it, with many greased palms in government along the way. Less than half of the money taken in by life insurance companies goes to pay benefits, the rest pays for high rises across America with life insurance company names on the top, huge executive salaries, corporate junkets, amazingly high salesman’s commissions, and often incredible profits.[\[4\]](#) Consumers get a better payout from the state-run lotteries. Even the “non-profit” status of mutual companies is largely illusory, as life insurance companies control more than one and a half trillion dollars in assets, and throw around a great deal of economic and political muscle, defeating all meaningful attempts to regulate their avaricious empire-building, gained by bilking the consumer.

The scam would be less onerous if the consumer had a choice, but people generally could not buy term insurance in America until the past generation. The policies existed, but no salesman would sell one. The Consumer’s Union of United States, Inc., the publisher of *Consumer Reports*, has advocated buying term insurance for almost all people for more than fifty years. Yet, it was nearly impossible to buy term life insurance in America. The reason was that term was *not profitable enough*. In the words of *Consumer Reports*,

“Although most companies offer term policies, selling term rarely brings in big profits, and companies encourage their agents to sell the more expensive alternatives. Encouragement takes the form of generous compensation for cash value policies. Naturally, agents - like most people - usually sell the

products that earn them the biggest commission.”[\[5\]](#)

Consumer Reports discussed the deceptions that life insurance salesmen use to dissuade consumers from buying the vastly cheaper term policy, as did Norman Dacey in his classic work, *What's Wrong with Your Life Insurance*.

The life insurance industry has relied on secrecy and lies to sell its product, such as the canard of “permanent need” and not telling customers where their premium dollar really went. If a public charity had such a low percent going to beneficiaries, it would be a tremendous scandal. More than ninety percent of money taken in going to beneficiaries is a normal percent these days for charities, after a number of scandals in the “charity” business. There is arguably \$200 billion a year going into zero benefit for the life insurance consumer in America today.[\[6\]](#) There is no rationale for life insurance payments being less than 95% of income for a national life insurance plan, except the need to build corporate empires. Today, the Social Security Administration provides a life insurance benefit for millions of people, with its administrative fee being less than 1% of income. The life insurance industry largely does not deserve to exist, except the rationale of capitalism and making people rich off the idea. The industry is basically \$200 billion a year of pocket lining. If the ultra rich want to insure their lives for big dollars, although there is virtually no rational need to do that, there may be a small legitimate market for commercial life insurance. If insurance companies want to be legitimate investment advisors, let them compete with other financial advisors, and not hide investment “management” fees behind life insurance premiums. The latest scam of the industry is “universal” life insurance, which Dacey exposes as the old scam (an even better scam, perhaps) in new clothing, in chapter 15 of his book.

Governments can be prodigiously wasteful, but [profiting off of selling addicting substances to people](#) and profiting off of [misery](#) and [death](#) (or the fear of it) may be the darkest aspect of our capitalistic system. Those areas are precisely where the big money is made in America.

There is some good news to report. Life insurance is also the only industry I know of where somebody succeeded in fighting its corruption and impacting their racket: enter A. L. Williams. He is something of an American legend today, and the only instance I know of where one man took on a huge, corrupt industry, and won. Williams started around 1980, only selling term insurance. His father died when he was young, and the life insurance proceeds did support the family long, and Williams eventually took on the industry, selling term insurance with part-time agents selling from their homes. Term insurance was the only kind of insurance they sold. Williams was selling affordable life insurance to the consumer, targeting the average American wage earner, and not using the proceeds to build high-rises and fund lavish corporate perks. The life insurance industry banded together and fought his company in a number of states. The racket was threatened.

By the mid-1980s, Williams’ company was skyrocketing, and by the 1990s sold by far the most life insurance protection of any company. Primerica was slandered throughout the industry. I saw the industry’s propaganda campaign against Primerica first-hand, when I have shopped for life insurance. As with every company, particularly one so successful, some Williams agents did some questionable

things, there was some empire-building going on in the company, and Williams himself left the company under a cloud of allegations. I wonder how much of that controversy was covertly brought into being by the life insurance industry's clandestine efforts.[\[7\]](#) With A. L. Williams, the average American parent of young children got life insurance that was really affordable for the first time, and that term life insurance did the only thing that "life" insurance is supposed to do: insure the interest of financial dependents in the event of a breadwinner's death. Before A. L. Williams came along, people simply could not insure their lives in America, but had to buy the insurance companies' other "financial services" that were wrapped into the package.

It can be argued that 150 years ago, when the life insurance industry was young, our government had no socialist leanings, so the industry was justified. Those days are long gone, and insuring untimely deaths would be one of the simplest things the government could do, and few in America would not support such a measure (except of course, the insurance industry). The life insurance establishment is so rich (from taking in more premium than was needed) that it is a huge economic and political powerhouse. It will not go away quietly. I favor dismantling the industry, fairly. I have a similar idea for [energy](#), [cancer treatment](#), and the other rackets. I favor letting them walk away from the table with enough chips to live well on, but calling the game over. Then the future money saved could be put to something productive, such as retraining life insurance salesmen and [oncologists](#) into productive members of society.

American saw the clout of a related insurance industry a decade ago when health care reform was attempted by the Clinton administration. The only real opponent to it was the [medical establishment](#), with the health insurance companies leading the attack. Wealth and power talks, very loudly, and they shot it down, along with intense lobbying and a propaganda barrage that is confusing Americans even today.

An odd thing about the issue is this: let us say that the life insurance industry was dealt a crushing blow by an epidemic disease or a meteor hitting New York City. Just as in the [Savings and Loan disaster](#), the government would make the taxpayer pick up the tab anyway. The taxpayers are in effect insuring the life insurance industry anyway.

Banking

I studied money and banking in college, audited several banks during my career and also worked for them. Banking can be quite abstract, and it can be difficult to see the bigger picture. I witnessed the beginning of the [Savings and Loan Scandal](#), from the inside, with my boss frankly admitting that my profession abetted it due to its structure, where auditors were not truly independent. The point has recently been driven home even harder with the [Enron](#) and other corporate scandals, although there is still is no move to reform it.

During [my days with Dennis Lee](#), before he was arrested the first time, I heard and read many right-wing theories about how the international banking system worked, how they were behind the Lincoln

assassination and so forth. A summary of that brand of theorizing is in Epperson's *The Unseen Hand*, and Mullins' *The Secrets of the Federal Reserve*. Those works are considered conspiratorial scholarship, and Edward Flaherty has a web site on the Internet devoted to debunking the "myths" that Mullins promotes. From the structural (left wing) perspective is William Greider's *Secrets of the Temple, How the Federal Reserve Runs the Country*. I had a difficult time believing the overarching conspiracy theory regarding the way the international banking system worked. Yet, I saw too many strange things to blithely dismiss the conspiratorial perspective; my attitude was kind of "wait and see." Even so, many aspects of the banking system were startling, from a structural perspective.

From the radical perspective comes the work of [Noam Chomsky](#), [Edward Herman](#) and other towering academics. Herman teaches economics at Wharton, one of the world's most prestigious business schools. Herman has produced many devastating analyses of how the capitalist system exploits the world's poor. His *Triumph of the Market* is an excellent introduction. Herman's work stacks up against any economist's. Herman, Chomsky and others point out how the international banking scene operates.

Two banking institutions that have played primary roles in enslaving billions of people are the World Bank and the International Monetary Fund (IMF). They are both neocolonial institutions that really work under the auspices of the United States banking system, although they are supposedly UN institutions. Their policies have [led to a great deal of starvation worldwide](#). No longer does the [British flag fly over India](#) and a quarter of the globe. The mechanisms are different, although their ultimate effects are nearly the same.

Here is how it works in the [neocolonial](#) world. The IMF makes a loan to a foreign government, for development, so they say. The loan is to a U.S. client state, which means that it is a dictatorship. The dictator and his cronies pocket most of the loan, where it ends up in their Swiss bank accounts (or the loan goes to building roads for oil company use, although the nation's citizens own few cars). Legally however, the nation is on the hook for the loan, not the dictator. The loan did not provide anything productive for the subject nation's economy, but just lined a dictator's pockets (or helped American corporations more effectively exploit the nation). The nation now has to pay the loan back. How do they do that? They end up raising crops for export to earn "foreign exchange" so they can pay the debt back, or chop down their forests, open their nation to strip mining, let the oil companies rape them or allow U.S. corporations to move there, taking advantage of the cheap labor there while putting Americans out of work. The IMF devises "Structural Adjustment Programs," (SAPs) that spell out those policies.

Land that was used to grow food for the local population is instead used to grow food or other crops (such as jute) for export. The local population starves so they can pay off the IMF loan, which went into their dictator's pockets. That is not a rare occurrence, but a typical neocolonial mechanism used to [rape the "Third World"](#). The relief organization [Oxfam](#) has published numerous papers on that issue. The last time I looked several years ago, of the forty poorest nations on earth, thirty-six exported food to the United States. That is how America gets cheap bananas, while the people picking the bananas, such as in Costa Rica and [Guatemala](#), cannot afford to feed their children. Billions of people have been exploited in just that fashion. That is why it is called [neocolonialism](#). The American flag does not fly over Costa Rica and Guatemala, but America gets their food. If the banana

pickers rise up against those exploitative conditions, the United States bankrolls death squads to keep the people in line, as in [El Salvador, Guatemala, Nicaragua, Indonesia](#) and so on. If it gets too out of control, then America sends in the Marines, to "[restore democracy](#)." Wink, nudge. Suharto and friends raped the Indonesian economy in neocolonial fashion to the tune of sixty billion dollars, eventually collapsing an economy that was already enslaved to Western interests. The IMF "rode to the rescue" in 1998, and its SAP was so draconian that the populace rose up and toppled Suharto.

That neocolonial process has been happening for a century, with [Wall Street's creation of Panama](#) being a pertinent early example. [Smedley Butler](#) was muscle for Wall Street, although he did not figure it out until after he retired. The Taft Administration's Dollar Diplomacy, following on the heels of Teddy Roosevelt's Big Stick Diplomacy, showed how the mercantile system complemented the purely military one. The current IMF programs are merely more sophisticated methods of slavery, which defraud people out of their land and lives. Once in awhile, something would leak from those institutions that [showed what was really happening](#).^[8] In reality, the United States is the world's stingiest industrialized nation, as even Jimmy Carter has openly admitted.^[9]

Other aspects of the neocolonial banking racket are the "free market" and international exchange rates. The "free market" is a situation where the rich and powerful are "free" to exploit the weak. The industrialized world's big banks, led by the United States, manipulate exchange rates to where Third World currencies are nearly worthless, so the peasants have the game rigged against them even more. They have to work harder to pay more to Western banks, because their currencies are artificially deflated against the industrialized nations' currencies. That is the "free market" at work. The SAP austerity programs kick in, and the nations are forced to abandon "frills" such as minimum nutritional standards, primary medicine and education for their populations. The World Bank has even been behind privatizing public water supplies, a practice that recently led to a cholera outbreak in South Africa) of course in the poor black towns. The water supplies of New Jersey are even being privatized as I write this in the summer of 2002.^[10]

It is a new form of slavery, but done through the banking system. The neocolonial New World Order has enslaved billions of people, and the 1999 WTO protests in Seattle were part of an effort to end the practice (I marched in the "Jubilee 2000" procession the night before, which is about forgiving the Third World Debt - I missed the tear gas the next day, to my relief). International treaties such as NAFTA and GATT are designed to break down all international barriers to the power of capital. It is designed to make the world into one big plantation.

That is not right wing paranoia. It is happening as I write this, so well documented that it cannot be denied, but the capitalist press has been busy brainwashing the American public, with the *Wall Street Journal* banging the drum. Recently, there was the debt "crisis" in Indonesia, Korea, Brazil and several Asian nations. South Korea's citizens protested the help that the IMF was about to give, and they knew how the deal would go down. In addition, the international currency markets have been turned into almost purely speculative affairs, a kind of global casino, something that even the *London Financial Times* has remarked on. The poor are the people paying for those policies, as usual.

I have friends from my business school days who think that those policies actually help those factory workers in Indonesia [who are making our Nike shoes](#). Establishment hacks do not dare debate

somebody like Herman in a fair and nationally televised debate, because they would be handed their heads.

Perhaps the darkest aspect of all the human suffering being caused by such monetary policies, with the United States leading the way, is that it is estimated that for forty billion dollars per year, every person on the planet would be guaranteed all the food, shelter and education that they need. Forty billion dollars is less than a quarter of the money that is squandered each year in the [Pentagon budget](#), just the part that is waste. It is surreal.

That part of the banking game is undeniable, not part of a bizarre conspiracy theory. That is how global capitalism works. Flaherty, an economist who loves debunking Federal Reserve conspiracy theories and apparently admires [Julian Simon](#), will not touch the IMF's shenanigans with a ten-foot pole. Simon, an *economist*, did not even mention the IMF in his "good news" manifesto, *The State of Humanity*. If *The State of Humanity* was a credible piece of scholarship, and Simon truly cared about the state of humanity, the IMF and Third World debt situation would have been one of the book's central concerns. Instead, Simon worshipped the non-existent "free market." The IMF situation is not "good news," however, except for corporate profits, Western consumers and the plutocratic elite of the subject nations, who have sold "their" people into neocolonial slavery.

A Neocolonialist Speaks Out

Reading [Ralph McGehee's](#) *Deadly Deceits* helped me figure out the American foreign policy game, similar to [Smedley Butler's](#) confession. McGehee and Butler had to live with their consciences and could not keep silent in their retirement years. I had heard about servants for the Rothschilds and Rockefellers writing memoirs about what really happens on the inside, only to have the books suppressed, including buying out the publishing companies that tried publishing the books. I have not heard of anybody publishing anything from deep inside the beast, but in 2004, a member of "middle management" of the global corporate empire spoke out, and John Perkins' *Confessions of an Economic Hit Man* is the [War is a Racket](#) of our time.

McGehee was an imperial foot soldier, not beginning to figure out the game until he came up with the "[wrong answer](#)" in America's war against communism. Perkins was on the "privatized" side of the empire, in what can be called middle management, and was frankly told about the nature of his job early on. His cronies literally called themselves "economic hit men," or EHM for short.^[11] He was taught the game from the inside. All the World Bank, IMF and USAID "assistance" was not designed to help the nations receiving the loans, but was designed to enslave those nations to the neocolonial order (or "corporatocracy" as Perkins called it), to give American corporate interests access to rape and plunder those nations, particularly to steal their natural resources and exploit their labor. The elites of those subject nations would be bribed to play along, but the primary goal was exploiting the peoples and resources of the subject nations.

Perkins' meteoric career took him to many neocolonial hot spots, such as Iran, Colombia, Saudi

Arabia, Indonesia, Panama and Ecuador. Perkins became friends with the populist leaders of Panama and Ecuador, Omar Torrijos and Jaime Roldós, who both refused to kneel to the empire and tried helping their nation's poor instead. He worried that the CIA and friends would assassinate them, and as soon as Ronald Reagan became president, Torrijos and Roldós died in "accidents" in 1981, where their aircrafts exploded in mid-air, in what were obviously CIA-style assassinations. Those assassinations served notice to the world that the relatively gentle days of Carter's reign were over. Those national leaders were killed by what Perkins called the "jackals." When bribes of IMF, World Bank, USAID and illicit funds are not sufficient, then it becomes time to set the jackals loose. If the jackals fail, the U.S. military is sent in, as with Iraq.

As with Perkins, the jackals rarely worked directly for the U.S. government, but were "privatized" covert action operatives.[\[12\]](#) Perkins was taught that privatizing covert action had been a trend ever since Kermit Roosevelt, the grandson of president Teddy, [overthrew the Iranian government](#) while working for the CIA on behalf of Western oil companies in 1953.[\[13\]](#) Being on the government payroll was problematic, as the Iran-Contra scandal showed. Privatized covert action operatives were much harder to expose and easier to deny, and their activities did not leave the paper trail that government operatives could leave. Privatized covert action was much tidier and could be more effective. Perkins likened the jackals to mafia enforcers, but the jackals serve global corporate empires, not local gangster turf.[\[14\]](#) I have a relative who was a privatized jackal who worked for a household-name "diplomat." His secret career destroyed his life, and I will not be able to publish his tale for a long time, for jackal-related reasons.

Perkins' first job was working for the Peace Corps in the Amazon, to see if he was fit for the rigors of EHM life in Third World countries (although he signed up for idealistic motives, as with most Peace Corps volunteers). The Peace Corps is also a [tool of the empire](#), and even some missionary groups are imperial tools, trying persuasion before the jackals are sent in.[\[15\]](#)

As with McGehee, those working for Perkins were not explicitly told about the true nature of their work, and it was the rare person who even *wanted to know*. Perkins kept his underlings in the dark about what they truly worked for, and often felt jealous of their naïveté.[\[16\]](#)

Perkins' path and mine crossed over the Seabrook nuclear power plant, as [I tried to help make it obsolete](#) while he promoted it, knowing that nuclear power was anything but safe and cheap.[\[17\]](#) Perkins' self-loathing over his life's path led him to publish his book, even though he was bribed handsomely to never publish his memoirs as an EHM.[\[18\]](#) He even got to start an alternative energy company that was bought out by an oil company for top dollar. Perkins always avoided the hero/martyr path, so never allowed the game to reach the stage of being [made an offer he could not refuse](#).

Depressingly, as with [other whistleblowers](#), his allies discouraged him from publishing his book. They did not want him to "commit the truth" and rock the boat. Perkins did not heed their advice and the world owes him a debt for his courageous act of conscience. As usual, he is obviously far less than [one-in-a-thousand](#) among the ranks of economic hit men, being about the only one to date to name the real game, particularly in book form.

The Darker Side of the Banking Game

Those [IMF-type](#) aspects of the banking racket are impossible to fairly deny, particularly in light of [Perkins' confession](#), and are part of the war against the poor.^[19] Conspiracy theories surrounding the Federal Reserve, the Rothschilds, [Rockefellers](#) and other elites I had read plenty about, but I did not know how true they might be. I did not see the overt evidence of it, it did not seem to affect me much, but during [my days with Dennis](#) I saw some things that made me wonder. The meeting that Dennis had with bankers and "European interests" that [wanted to pay him a billion dollars or so](#) to stop pursuing free energy, dives straight into the international conspiracy theories. The offer appeared to include the international bankers, and made the conspiracy theories seem more tenable. In the past several years however, I saw and heard more things that *really* made me wonder.

In 1999, I went on a business trip to Chicago. It was in the rich part of Chicago, a couple miles from Michael Jordan's house. I set up banking arrangements with a local bank and spoke with a banker who represented a trust with more than a *trillion* dollars in assets. They served the old money crowd, keeping their zillions invested properly. It was not the first time that I had dealt with a trillion-dollar trust.

Back in 1996-1997, when Dennis was trying to raise billions of dollars to fund [Yull Brown's technology for neutralizing nuclear waste](#), I had my eyes opened and peeked into a world that I did not know existed. When I started getting into it, I asked my CFO and big time CPA friends what they knew about it, and none had ever heard of it before. I became introduced to the world of offshore trusts, bank trades and other ideas. It was a strange world, and I ended up dealing with people in the game.

Some was surprising and huge, and some was surprising and trivial. For instance, we shopped for banks to hold the billions of dollars we were going to be depositing. It was not a pipedream; we had players who could have delivered that kind of money. When looking at the most financially stable banks in the world, I was surprised to see that only one American bank made the top twenty-five. It was Morgan-Guaranty, a bank not heard much about in America. Half of the top twenty-five banks were German. That left me scratching my head. I thought they lost the war. The offshore trust racket is a way that the rich avoid paying taxes. It is an international shell game, and the big loser is the taxpaying public.

The world of bank trades was strange. When the average investor buys a certificate of deposit (CD) from a bank, earning seven percent, for instance, they are buying a "retail" bank instrument. The CD game that the banks play is similar to the game that sees a compact disc, which was made for less than a dollar, sell for \$15 in a department store. Between the producer and the consumer was a host of middlemen who got their cut along the way. In the capitalistic world, it can be stunning to discover that the price of the product is nearly all to pay for distribution. Time and again, I have seen producers receive ten cents or less of the retail dollar of a product. Even inside the producer's organization, I would see more than ninety percent of the cost of producing a product was the overhead, and ten percent were the direct costs of production. For instance, I worked in a [medical lab](#), and the direct

cost of producing a particular medical test was one dollar. We had overhead and markup that made our price to the doctor more than twenty dollars. The doctor would mark up the test to pay for overhead, such as insurance company administration and get his/her cut, and the patient's bill might read as high as fifty dollars or more for that test.

That situation is "normal" in many industries. Who is making the money, and what are they doing to earn it? To a degree, such a situation seems understandable, although it can be a neat racket. I sometimes saw organizations receive hefty cuts from that retail dollar for doing not much, if anything, but their powerful positions meant that money flowed their way. The greatest racketeering has often been of a seemingly minor, unobtrusive nature. I believe I was seeing an old dynamic, probably as old as history. When [Great Britain conquered the world](#), the capital class there made tremendous fortunes. Owners of [Britain's East and West India](#) companies made vast fortunes while sitting in their English estates, while Britain's lower classes lived grim lives abroad, laboring for the companies, with the colonial subjects' lives even worse, as the loot flowed into the coffers of the rich. Those dynamics turned [Bengal from one of the world's richest regions into one of the poorest](#), a dynamic [that continues to this day](#). Monopolies, from Standard Oil to Microsoft, raked in the big money. People have vilified John Rockefeller and Bill Gates, but had no viable option other than buying their products.

A similar situation appears to exist in banking. When the customer buys a CD at seven-percent interest, the original issuing bank for that CD paid out perhaps forty-percent interest. The CD was passed from bank to bank, each bank taking its middleman cut, and stripped down that forty-percent initial rate to seven percent. Not many Americans know how that game works. It was new to me. Unlike pressing a compact disc and moving it around the world, ending up in the music store at the local mall, what "added value" happens when those banking CDs are passed around? I dealt with people who brokered such CD "wholesale" deals, and made them. They spent time educating me in how it worked. A number of them made no bones about how the elite ran the game, and the Federal Reserve conspiracies that Flaherty enthusiastically debunks were wholly accepted by many in that crowd. One told me that the Rothschild syndicate owned the Federal Reserve "lock, stock and barrel."

During those days, we dealt with folks who were prepared to commit billions of dollars to us, but Yull Brown blew those deals apart. People have said that Dennis unfairly treated Yull Brown. I was there and saw what happened. Dennis and his organization treated Brown like a king, and paid him like one.

One strange thing happened during my dealings with the big money crowd. They cautioned us against putting *any* money in the United States banking system. They coached me on how to set up foreign banking arrangements, and let us know in no uncertain terms that using the U.S. banking system was inviting disaster. Why? Here is where it gets surreal. They said that if we began doing anything that threatened the status quo, the U.S. banking system would essentially seize our funds and put us out of business. That might seem bizarre; after all, our checks clear our banks after we write them. I did not know what to make of such sentiments, until I dealt with another person who represented a trillion-dollar trust. Such sums of money boggle my mind. The two I dealt with were not household names. That trust that I met during my Dennis days did not cater to the old money crowd, but was a radical group. It examined the proof of their assets, and it seemed legitimate, and some big

players knew who they were and did not scoff. They were either a front organization for the CIA, etc., or they were legitimate. The trust's assets were more than one trillion dollars. I spoke with the trust administrator numerous times. He admitted that the trust's equity was "only" about twenty billion dollars.

A dozen years ago, as the Soviet Empire was crumbling, the trust gave a billion dollars to a regime to keep it from collapsing. From what I could tell, it appeared that they did it largely as a humanitarian gesture, to keep the situation from degenerating into violent anarchy. They were not part of any government, but a private organization that fed starving soldiers guarding nuclear missile silos. They apparently ticked off those who think they run the world.

Their cash was nearly all held in the U.S. banking system. Soon after they made the "gift" to the communist nation, the U.S. banking system uniformly froze all their funds. They froze about twenty billion dollars in cash. Several years later, it was still frozen. The banks claimed "liquidity" problems regarding the trust's moving around of its funds, but it was a transparent lie. A United States Supreme Court justice even ordered the banking system (several major banks were involved) to stop freezing their funds. Essentially, the U.S. banking system gave the Supreme Court the finger. It was mind-blowing, but it demonstrated who really ran the show, with the Supreme Court being inconsequential nuisances in comparison to the banks' raw power. Flaherty's debunking became increasingly unbelievable in light of what happened to that trust. I will not laugh at any international banking conspiracy theories in light of what I saw.

Law

One of my first jobs was cleaning attorney offices. Friends and family members are lawyers. My first significant encounters with America's legal system were during my days with Dennis. In [Seattle](#) and [Ventura](#), with other hints in [Boston](#), I saw lawyers, judges, policemen and investigators committing great crimes. [Lies](#), deception, intimidation and felonious crimes seemed to be the specialty of those who worked in the legal system.

I now realize that my initial impressions were somewhat extreme. I saw people following orders from those who ran the energy racket. On one hand, officials who committed those acts were merely following orders or chased the carrot dangled before them. Most did not realize they were engaging in activities that might exterminate the human race, but most probably did not care, either, as long as they were amply rewarded for their efforts. Over the subsequent years since I gained a different perspective of our legal system, but it is little brighter than what I perceived earlier.

This site deals with the idea of the evolution of souls through the physical plane experience, and world history largely deals with the activities of [baby and young souls](#). In relation to the legal system, legitimate and illegitimate application of the law can be a useful way to perceive the dynamics. The Ten Commandments were righteous, yet they were mainly about forbidden practices. For their day they worked, although few ever lived by them, Moses breaking his first tablets in disgust. The Fifth Commandment forbids murder. The commandment is clear and unequivocal, but many clever people

have created an exception to that Commandment whenever the need arose, such as matters of war, to "defend" one's self, executing "criminals" and so on. Those clever sophists were among the earliest lawyers.

In the Bible, [Joshua](#) committed genocidal slaughters, depopulating entire regions for his God, the same God that forbade murder. David was a god-chosen warrior-king, with beheading Goliath an early feat. The law was ignored or argued around from nearly the day it was given. Even when Jesus came along and said to love the enemy, Christians have largely ignored that also, always rationalizing their slaughters. [Europeans](#) (and their political descendents such as America) are the most murderous people of all time, by far, and they are nearly all Christians.

Laws can be legitimate aspects of creating civilizations. In early civilizations the laws are simple, such as the Ten Commandments. They generally "work" when followed. People can believe in the law and its application. If everybody follows the law, all will be well, or so they believe. To some degree it is true. Laws that the general population does not believe in do not work well. In those more "primitive" civilizations the laws are simple, and their rules often applied relatively fairly, although they may be harsh, such as the murderous code in the book of Leviticus, which directly contradicts the Fifth Commandment. When the law is followed because it is the law and not because it is just, it ventures into legalism. The spirit of the law is ignored while the letter is followed. Further degeneration is when the law is used as a weapon for personal gain, not for justice or helping hold civilization together. The law becomes seen as a tool in winning. Serving justice, the spirit of the law and the ideal are lost, and the only goal is winning.

That is about where the United States' legal system is today, and the West's in general. The American legal system is all about winning, not justice, which is generally the final stage of a legal system's degeneration. The law also becomes extraordinarily complicated, and professional specialists make and interpret laws that no regular citizen can figure out. When that happens, the legal system is no longer under the citizenry's control. Legalism overthrows justice and serves those who control the legal system.

Ancient Rome just before its collapse was like that.[\[20\]](#) The tax system was extremely unfair, and tax collectors and lawyers were thoroughly corrupt, just as in today's United States. The legal system was an extraordinarily complicated maze of laws that no citizen could navigate without a lawyer's help, and the lawyers often betrayed their own clients. The only winners were the lawyers. Today, seventy percent of the world's lawyers live in the United States, and the last time I checked ,somewhere around ten percent of them are millionaires. That is a symptom of a society in decay and on its way out.

The state of America's legal system, with its extraordinary complexity and thorough corruption, where an honest lawyer (one who seeks justice, not winning) is nearly impossible to find, is simply a sign of the times. That so many point to a scrap of parchment, the U.S. Constitution, and hold it to be holy (or even worse, [the flag](#)), is another sign of the times. George Washington crafted a legalistic strategy to [defraud Native Americans out of their land](#), which was immediately embraced by the government, to demonstrate the [Founding Fathers'](#) reverence for the law.

There is *no* system worth worshipping; worshipping any system is a form of idolatry. The U.S. Constitution was [influenced by Native American tribes](#), and was designed to limit the power of government, and has failed miserably. A piece of paper cannot prevent corruption. If everybody found a way around the unequivocal Fifth Commandment, finding a way around the Constitution has been easy. Our government increasingly does not even have the pretense of serving the public interest and the public knows it, which is why Americans [vote less than any "free" people on the planet](#), because they know it does not matter. The same rich people own all the candidates, and the laws are written and enforced to look after powerful interests. That is also why the underclass populates [America's prisons](#).

In a healthy society there are few laws, everybody knows them well, and no lawyers interpret them. There are also no prisons or punitive institutions. There were no prisons in the New World in 1491. That is the polar opposite of the United States. Neale Donald Walsch's *Conversations with God* states that in highly evolved societies they only have three laws. They are:

1. We are all one;
2. There is enough for everybody;
3. Nobody has to do anything.[\[21\]](#)

The only earthly societies ever approaching that ideal have been "primitive" societies. Communism (at least the Soviet and Chinese versions of it) tried living by the ideals of one and two, but did not live by rule number three. The Declaration of Independence expressed law one (except for calling Native Americans savages), but the Constitution did not originally approach that ideal, with slaves, natives and women specifically excluded from the "we are all one" ideal. Nearly all American laws are coercive, which also ignores rule three. Capitalism, on the other hand, sort of honors rule three. Nobody has to do anything, but if they want food in their belly and a roof over their head they need to labor for the capitalists who own everything. Capitalism is diametrically opposed to rule two, [elevating greed to a virtue](#). Capitalism does not even pretend to honor rule one. Nationalism is also diametrically opposed to rule one. It is us versus them in nationalism, each nation believing they are a great people, and that "great people" self-image is then used to justify warring against their neighbors, egotistically elevating themselves in their eyes at the expense of others. Nationalism often exploits the masses for elite benefit. Racism and most religions also ignore rule one. People are OK only if they belong to the right religion or race. Most Christian sects ignore rule three, with the more literalist sects requiring that people accept Jesus as their personal savior in order to be "saved." As Walsch's god observed, America is a primitive society, and one mark of a primitive society is how it regards regression as progress.

My friends and family members who became lawyers were starry-eyed in the beginning, much as I was [when I attended business school](#). Their eyes were opened much faster than mine were. They either got out of law or became bitterly cynical a few years after receiving their law degree, and sought niches of the profession that were less revolting than others. None of them have any starry-eyed

idealism about our legal system anymore. As far as providing any benefit to society, our legal system could disappear tomorrow and everybody would probably be better off. "Anarchy" is probably preferable to the juggernaut that is taking the world to the brink of destruction.

Several times I have seen American judges make rulings that made a lawyer's jaw drop open, with the lawyer saying in dismay, "They can't do that!" Dennis has seen it more times than he cares to remember. When the people who run this nation use the legal system to wipe somebody out, the law is not worth the paper it is printed on. The police [commit felonies](#) while fabricating charges that the prosecution [fraudulently pursues](#), and the judge rubber stamps it all and makes sure that anything *but* justice is served as they kangaroo their hapless victim into a long prison stint, and perhaps also arranging for the inmate's murder in prison. All those officials had their palms well greased to participate in the snuff job, with promotions, money under the table, and other benefits. If I had not lived through it, I may not have believed it. It works that way in both the [medical](#) and energy rackets. Dennis has called it the "just us" system. More than once I have seen lawyers who challenged our legal system become quickly disbarred on fabricated charges or [threatened with it](#) to keep them in line.

Every profession and industry has prostituted itself to one degree or another, but the legal profession probably sells itself to the highest bidder more often than any other. Most of America's politicians are lawyers, as well as its judges. I am not sure exactly what lawyers make in America, but it is probably somewhere around thirty-to-forty billion dollars a year, for another complete waste of money. It is worse than a total waste, as they are helping prop up our ethically bankrupt system.

Housing and Construction

During my days with Dennis, we dealt with many inventors. Some inventions were truly extraordinary. To my eventual dismay, and a realization I resisted for many years, the biggest obstacles are not really the "bad guys" protecting their turf from innovation, as in the medical racket and [cancer treatment](#). Most inventors we met were greedy. Their greed and dishonesty sabotaged more deals than being squashed by the "bad guys." Also, Dennis' allies hurt him more often than the "bad guys," also having greed as their primary motivation, when it came time to show their true colors. The same happened with most employees, when times got tough.

One group we dealt with was Australian, and they developed a plastic house. It was made of a revolutionary plastic, and was made into modular pieces. A three-man team could build a house from it in two days without even using a hammer, and it would last nearly two thousand years. The houses looked good, and were cheaper than houses of today. As usual, they ran into many obstacles, such as the construction industry trying to wipe them out, their partners making things difficult, etc. If homes were made from that plastic, the world would be housed in a few years at significant cost, but then nobody would need to build a house for two thousand years. In the United States today, about two hundred billion dollars a year is spent on residential housing, with about another hundred billion a year spent on non-residential construction.

It is not *any* stretch of the imagination to see a worldwide construction project where everybody gets a home that will last two thousand years. That is only one way to do it. There [are others](#). In those scenarios, everybody has a dwelling that is paid for, free and clear, and it will last thousands of years. Amortized over two thousand years, the cost of housing virtually vanishes. Also, it would end one of the darker aspects of our "civilization" - most Americans and most people on earth are only a few paychecks away from being thrown out onto the streets. It is a barbaric and inhumane system, but is a great racket for [banks](#), the construction industry and other predators. That global housing situation is a major reason why people live lives of quiet desperation, knowing they are always near the edge, and have to keep punching that clock or be homeless. The housing situation helps keep humanity enslaved. Houses can be made out of completely recyclable materials, have high quality, can be made to exist in harmony with the environment, to where humanity could live indefinitely on the earth, with dwellings that cost virtually nothing.

Agribusiness

When the [USDA tried regulating the organic food industry](#) in a way that would have nearly eliminated it, the voice of agribusiness was heard. Fortunately, 250,000 American voices, including mine, were heard, so we won that round. The bedrock of the world economy is food, and has been so for as long as human beings have walked the earth. [Agriculture probably began](#) when hunter-gatherers [drove all the easily hunted big animals to extinction](#). Ever since, the "agricultural surplus" has been the basis for all the world's civilizations. As forests are the primary creator of soils, razing forests to grow crops has always eventually destroyed the soils. Deforestation, irrigation and plow agriculture led to soil salination, mineral depletion, soil loss and desertification. The [long, slow decline of Sumeria](#) demonstrated the long-term effects of agriculture; the Fertile Crescent is largely desert today. Modern industrial farming, combined with [neocolonialism](#), has wreaked environmental devastation on a much vaster scale and far more swiftly.

As civilizations rose and fell, with copper, [bronze](#) and [iron](#) ages increasing humanity's ability to manipulate the environment, agriculture became more sophisticated. Because North America probably had [the world's healthiest soils in 1491](#), as the natives lived lightly on the land, the invading Europeans inflicted environmental devastation that had no precedent, but the land had enough biological wealth to survive the onslaught...so far (although events such as the Dust Bowl happened). The rise of capitalism combined with the [rise of the United States](#) led to agricultural empires. There were no robber baron farmers during the Gilded Age, not of the stature of Rockefeller and other industrialists, although there were ranching empires.

For years, I was skeptical that the food industry would turn into a monopolistic/oligopolistic industry, as energy, medicine and other large industries had, because there were so many small farms and growing food is the world's most widespread industry. However, large segments of agriculture have been taken over by corporate conglomerates. Many world food markets are controlled by a handful of companies. For instance, two companies - Cargill and Archer Daniel Midland - control about 80% of the world's grain market.

Monsanto and other companies are creating genetically engineered seeds that create sterile crops, forcing farmers to buy more seeds the next year. They are also making seeds dependent on artificial fertilizers and pesticides. It is even scarier than that. Monsanto came out with Bovine Growth Hormone (BGH), which sucks even more milk and life out of those [factory cows](#). To millions of Americans, such practices are not only scary, but evil. With the introduction of BGH, organic dairy farmers began advertising that there was no BGH in their milk. Because agribusiness companies largely own the USDA, in a classic instance of [regulator capture](#), nobody could count on the USDA to find that BGH was harmful. In an Orwellian summersault, Monsanto sued the organic dairies, trying to *make it illegal for them to state their milk did not have BGH in it*. It is similar to the agribusiness attempts to define “organic” to allow [genetic engineering, irradiation and sewer sludge](#), then outlaw any higher standard. Fortunately, the American legal system is not yet [that far gone](#), and Monsanto did not get its way in court.

Far more frightening than Monsanto’s BGH antics is what is happening in the realm of genetic engineering. As industries vent their pollutants into the environment, with industrial assets such as [Elizabeth Whelan](#) providing helpful disinformation, at least PCBs will one day break down into harmless compounds. With genetically engineered (GE) organisms, however, it may not be possible to stick that genie back into the bottle. There are already cases where GE organisms are inadvertently killing butterflies and other insects. Europe has risen up against the “Frankenfoods” America is producing, and accordingly, American agribusiness, through [neocolonial institutions](#) such as the WTO, are inflicting punishment onto Europe for daring oppose the introduction of GE products. An internal memo leaked from an agribusiness company that presented their strategy. The plan was to flood the world with GE organisms, and as the contamination becomes universal, anti-GE advocates will throw up their hands and surrender. A leaked Monsanto memo showed its global strategy for rigging GE regulation throughout the world. While most Americans sleep through the process, there is a [fierce battle happening across the world](#), as nations resist the introduction of GE foods.

There are horrifying aspects of the current GE craze in agribusiness, but the scariest GE aspect is biological warfare experimentation in the U.S. military establishment, generally with zero oversight from any governing bodies. The U.S. military has long used genetic engineering in its biological warfare research. The “Captain Trips” of Stephen King’s *The Stand* is closer to becoming reality each day. Calling it genetic “engineering” is a misnomer, as scientists barely understand what they are doing, injecting DNA from a fish into a tomato, and seeing what happens. They are playing with forces they do not respect or understand. Toying with life’s building blocks that way, especially when their [understanding of life](#) is so degenerate, may unleash a Captain-Trips-like disease that kills off most of humanity, and *inadvertently*. There is plenty of suppressed and ignored evidence that today’s [orthodox understanding](#) of disease is [flawed](#), and that catastrophic epidemics may be more the result of misery and despair than biological mechanisms. With all the misery being inflicted onto humanity today, with the [United States leading the way](#), a major global epidemic, perhaps something like airborne AIDS, could well sweep humanity, and soon.

The “Green Revolution,” which dramatically increased crop yields for a generation, has been hitting the wall of diminishing returns for years, and at great cost; artificial fertilizers, pesticides and other practices are poisoning the environment at unprecedented levels, and water tables are plunging

across the world from irrigation over-pumping.[\[22\]](#) Asia, with the world's largest population, is rapidly running out of arable land, partly due to its rapid industrialization, as it plays catch-up with the West. Already, China and India are quickly becoming dependent on grain imports from the U.S., Canada, Australia and Argentina. Japan [became grain dependent long ago.](#)[\[23\]](#) The current [global warming](#) trend threatens to create crop failures even more devastating than has been seen in Africa and Asia during the past generation. Exploding human populations, combined with fast-disappearing croplands and forests, combined with global warming and air pollution disasters that have been happening in Asia and Indonesia the past few years, may well conflate into a famine of a magnitude the world has not seen before. If China and India begin starving, it will not happen quietly, and could trigger a global war.

The food industry began rapidly consolidating during the merger and globalization mania of the 1990s, and *global* food monopolies are on their way to becoming a reality. I doubted it was possible fifteen years ago, but have since revised my thinking. Combine that trend with the disinformation about nutrition that industrial hired guns such as [Steve Milloy](#) and [Elizabeth Whelan](#) have been disseminating, and the coming storm clouds are ominous. The food racket is nearly here.

Transportation

The transportation industry is closely related to the [energy racket](#), with car companies working closely with oil companies [to wipe out energy conservation in transportation](#). The transportation racket is about the first one I became aware of, when [my mentor invented the world's best engine](#), and was told to [make his funeral plans](#) if he was serious about developing it. Transportation in America is a virtual monopoly, with nearly every aspect of it controlled by oligopolies that operate in collusion with each other and the energy racket. America's primary mode of transportation is the automobile, and there are essentially three automobile manufacturers in America. The story of the Preston Tucker snuff job, fifty years ago, is a standard case of how the automobile industry protects its turf. The man who told Dennis [how his car company was wiped](#) out is one of many stories like him.

The airline industry now has only two vendors for planes: Boeing and Airbus. Virtually all United States air traffic is controlled by a handful of airlines, and they raise and lower prices in concert. I recently worked in the travel industry, and industry veterans openly admitted that major airlines colluded with each other, which was obvious as they regularly saw them raise and lower prices in unison. The automobile and airplane industries are virtual monopolies, in classic, capitalistic fashion. Monopolies are *a/ways* rackets.

The bona fide conspiracy between General Motors, Rockefeller oil companies and Firestone Tire to dismantle mass transit systems in America, especially in Los Angeles, is well known, performed under the rubric of National City Lines during the 1930s. There were many activities engaged in where oil and automobile interests had an interlock of interests, with the public paying dearly, such as [putting lead into gasoline](#).

I have heard first-hand tales about how [General Motors stole innovations from inventors](#), and have encountered many other instances of theft, such as the mechanism for intermittent windshield wipers, [power steering](#), etc., while suppressing other innovations, [such as high efficiency carburetors](#). Automobile companies steal what they can, [wipe out competitive upstarts](#) with kangaroo court and other strategies, [foist poisons onto the public](#) and are the world's most effective practitioners of "planned obsolescence," where technology is designed to quickly become obsolete, in order to sell the next version of it, keeping the consumer running in a kind of squirrel wheel. The automobile industry epitomized U.S. capitalistic gangsterism.

This transportation racket section will conclude with a personal anecdote. Walk into any auto parts store and see the shelves where windshield wipers are sold, with the packaging boasting that the wipers are made of "natural rubber." Some wiper blades will be treated with graphite, for a smoother wipe and longer life, which cost more than twice what other blades cost. That entire wiper section is completely unnecessary. Those "natural rubber" blades need to be replaced each year because the blades' edges wear out. The "natural rubber" blade is about the flimsiest one that can be put on a car. There are many kinds of rubber, and automobile tires are made from Nordel rubber. Nordel is a specially treated rubber, so tires last 60,000 miles and more while running over roads, not smooth windshields. In 1990, I saw a mail order ad for wiper blades made from Nordel rubber, which were guaranteed to last for the car's life. They sold for less than \$20 for a pair, about twice what normal blades cost. I bought two pairs for my cars. Unfortunately, they put their "indestructible" blades in cheap plastic frames, and one pair broke during the first Ohio snowstorm it was in, as the frames had to contend with the strain of snow and ice on the windshield. That was an example of the poor design decisions that [plague all inventing](#). The other pair's frames, however, did not break in snowstorms. Those blades worked fine for the next eight years, until my car was destroyed by another car crashing into it. If my car had not been destroyed, I am sure those blades would be serving me today, more than eleven years later.

Today, nobody sells Nordel blade windshield wipers, except for extremely high-end wipers for RVs and such, costing more than one hundred dollars per pair. Why? Putting Nordel rubber in windshield wipers on cars in the factory would cost only a few cents more per car, and those blades would last for the car's life. Instead, there is an entire industry devoted to replacing windshield wipers every year. The windshield wiper blade industry is a scam. That is only one minor component of cars, but that situation typifies the kinds of "planned obsolescence" and other activities that are outright racketeering.

Waste Management

Waste management is a huge racket, and part of a diabolical design. One favorite racketeering strategy is to make a huge amount of money in creating a problem, and then make a huge amount of money in "solving" it. The "solution," however, is never the best one, and the public is milked for generations to "solve" the problem. The nuclear energy industry is a classic example of that strategy. Free energy [has probably been suppressed](#) for nearly a century, going back to [Tesla](#) and even earlier. The nuclear industry created immense environmental devastation and [human harm](#) in

producing and refining the uranium used. Vast sums of money have been made in that business. The [war racket](#) also came to that trough, with the insane (or diabolically sane) buildup of nuclear weapon stockpiles. Cleaning the mess up is another huge racket. [I spoke at Department of Energy \(DOE\) hearings](#) regarding the nuclear waste problem. The nuclear waste problem is one of the more dangerous that faces humanity at this time, and the management of it has turned into a racket, with viable solutions ignored, as even admitted to us by the DOE.

With more mundane waste, such as municipal garbage and landfills, it is well known that organized crime virtually runs the industry in America, especially in Chicago, New York and other eastern American cities. During my days with Dennis, I watched ingenious answers to municipal and industrial waste problems be squashed by those who run the waste management racket.

When the CIA is examined, with [Wall Street dominating it](#), and it [hiring the Nazis](#) and the Mafia, the realization quickly arrives that there is little difference between a Nazi, a gangster, and a CIA civil servant. They all work for the same team. As [Smedley Butler remarked](#), members of the Italian Mafia are minor leaguers. The Mafia does stuff such as take over labor unions and municipal waste management, and serve as [drug middlemen](#). That is the small stuff. The big rackets are taking over the federal government and managing nuclear waste, sending out armies to enslave entire nations and [running the prisons](#). That is the big time racketeering. The Mafia are small timers, which is why they end up in prison. The big time criminals, such as most of our [U.S. Presidents](#) and [corporate executives](#), never go the prison, although the blood on their hands is vastly greater than Al Capone could have ever aspired to. The big gangsterism is done while [waving the flag](#), sitting atop skyscrapers, lounging on palatial estates and pursuing the sacred profit. Most of waste management is a waste, with cheap and effective solutions wiped out, and answers such as not creating the waste in the first place, or [completely recycling it](#), forbidden.

The Capitalism Racket

This essay could present the racketeering aspects of many other industries and professions, but the point has probably been made: they are *all* self-serving above all else, because [people are mostly self-serving](#). When American executives candidly admit the only purpose their industries have in existing is not serving the public, [but making a profit](#), it is admitting that serving others is a charade, as the real purpose, the *overriding* purpose, is serving one's self.

This site's [series of racketeering essays](#) has examined industries and professions whose revenues total far more than half of America's economy; none of them deserve to be the size they are, and industries such as [energy](#) and [war](#) do not deserve to exist at all. To state that half of America's economy is worthless might be conservative. It might be more than two-thirds.

In the medical racket, monopolistic practices are not undertaken by one company, but there is a [monopoly of method](#). The [life insurance racket](#) was also that way, as [are the oil companies](#). There

can be a number of players, usually a few big ones, but they all sell the same shoddy product for about the same price. The "innovations" are never significant, with far more flash than substance, and the cash registers keep ringing. It is not a law of nature that a few big players come to dominate all those industries. It is how earthly power works, always grabbing for more. [Greed is always insatiable](#), because it is rooted in an irrational fear. That is why all industries tend towards monopoly: it eliminates the competition so huge profits can be made from milking the captive consumer. There are no free markets. Wall Street's mega-merger mania is part of the phenomenon.

Capitalists hate the idea of competition, and their primary goal is eliminating it (John Rockefeller even called competition a "sin"), as [Adam Smith observed](#). It is the essence of capitalism. Capitalists eliminate the competition any way they can. If their competitive adversary is too big, they either collude with them or buy them out. If their adversary is somebody [small like Dennis](#), they squash them using the system they control, which includes the [press](#) and [legal system](#). It does not always have to be a "conspiracy," as such. The [Western press is corporately owned](#), virtually without exception. Therefore, corporations can do no wrong, and the general worldview the media presents is how great capitalism is, *because the capitalists own them*. The same people own the government and [legal system](#), just as [John Jay said](#), so the [media](#) and legal system can deliver [a devastating one-two punch](#) to Dennis and other hero/martyrs, with only a few people really being in on it.

Capitalism, organized religion, nationalism and all the "isms" have degenerated into rackets. Adam Smith had interesting ways to look at capitalism, something that existed before he gave it a name and provided a theoretical framework. Smith would not have approved of today's corporate capitalism. Smith called the profit motive the "vile maxim of the masters." Corporate capitalism, as with [colonialism](#), is another way to [exploit the masses](#), while calling it "[progress](#)." Smith and Marx agreed that the workers should control the capital. The corruption of the ideal that Smith saw is similar to the way that [Jesus' message was corrupted](#), Buddha's, Mohammed's, etc.

A Jesus, Einstein or Adam Smith will look at the world in a new way. Their vision is extraordinary, and usually far ahead of its time. It soon becomes co-opted by the greedy and power-hungry, who twist it in sometimes subtle ways to serve their ends. The fraudulent aspect is how the corrupted message becomes a dogma drilled into people's heads, and a twisted version of the original vision is used to control people, keeping them part of an exploitable herd. Every "ism" is like that, without exception.

Smith saw economic dynamics as separated into rents, wages, interest and profits. Standing alone, that can be a useful way of looking at it, but in other ways it makes [presumptions](#) that other societies did not necessarily share. Rent is considered the economic exchange for land use. The presumption underlying that idea is that somebody owns the land. As pure theory, the idea has merit in that land has a real cost associated with using it. Yet, Native Americans, for instance, could not comprehend the concept of [owning the land](#), even when it had been imposed on them for centuries as a way to dispossess them. To many Native Americans, owning land was like owning the sky. Owning *anything* is an egotistical and materialistic concept. All we truly own are our bodies while we are here.

Smith's concept of wages was imputing a cost for performing labor. By itself, the idea has merit, but it became corrupted just as the rent concept has. While Smith was writing, slavery was alive and well, so the idea of owning people was popular. With the Industrial Revolution, which Smith specifically

wrote about, the idea of renting people instead of owning them gained in popularity. Again however, the idea as enacted today is that of a fixed wage, as there is a fixed rent. Those are *presumptions*, not laws of nature. The way Smith separated capital from land and labor was an artificial designation. In capitalism, there is a fundamental antagonism between capital and rent and wages. Capital is nothing more than the fruit of land and labor that somebody skimmed off, calling it their own. The capitalist commands the land and labor, usually violently, setting fixed rates for their use, and the capitalist gets what is left over. In practice, capital represents little more than theft, cleverly done. Capitalism is anything but democratic. Communism was a flawed attempt at economic democracy. Its great flaw was that it was not voluntary.

It was weird to finally read some Marx during my awakening and see that he was saying things I had already figured out on my own, from *within the capitalist system*. [Butler](#) did not denounce America's capitalist imperialism because he was a Marxist. He came to his conclusions from having open eyes and the honesty to admit what he saw. The same goes for [Ralph McGehee](#). McGehee was a true believer in his anti-communist mission. He realized the dishonesty of it from the inside, and realized it *because* he believed in his indoctrination, so much so that his Boy Scout honesty drove him to pursuing his ideal, to finally discovering the Big Lie he had been fed. He also realized that nobody else wanted to hear it, because it might lead them to question what they were doing, and few are brave enough to do that. To paraphrase a Catholic pope, "If you brainwash them when they are young, they will never overcome it."

What Native Americans called Mother Earth [became the white man's "capital."](#) One man's living space or labor is stolen or exploited and called capital by the thief. Smith's theorizing is an abstraction, a systematic and artificial way of viewing the world. By itself, there is nothing wrong with that, or Marx's theorizing. They are not reality, but *theories*. When they become dogmatic catechisms drilled into young heads like mine, then they become methods of control. *There is no ideological system worth believing in.* Any system is simply a tool. Do we not discard wrenches if they break and are no longer useful? The systems usually benefit those who devised them; which includes nationalism, religion and communism.

Corporations are artificial entities that capitalists have worked hard at giving superhuman rights.[\[24\]](#) It has created extremes that earth has never seen before, where Bill Gates' net worth is greater than the combined net worth of more than 100 million of his fellow countrymen, a fortune he amassed in the span of twenty years. That is not a law of nature, but the outcome of a system founded upon [greed](#). It is not Bill Gates' fault; he is just a lucky player in a lottery that most Americans want to play. Corporate capitalism's great crimes are about not sharing the wealth, and [destroying](#) the world's [real wealth](#) at an unprecedented pace. Global corporate capitalism is [international piracy](#) wearing pinstriped suits. It used to wear top hats. Now it has gone "casual."

Activists are proposing common sense solutions to limit corporate power, and it has the capitalists shaking in their wingtips. One proposal is that if a corporation does something truly reprehensible (as most of the *Fortune* 500 has), the government has the power to revoke its charter, dissolving the corporation, distributing its assets to the injured and society at large, and the world has one less rapacious corporation. That may get the attention of shareholders and the nature of their societal responsibilities. [Profits are not sacred](#), but are another artificial aspect of corporations. The

sacredness of profits sanctifies being [self-serving](#). Other activist proposals are: banning political advertising on television, [which is largely mud wrestling anymore](#), which would be welcome to everybody in America, except those who own the politicians; stripping corporations of those superhuman rights; trust busting the [media](#), breaking up its corporate ownership; and others.[25] The burgeoning [Enron](#) and related scandals will make those “outlandish” solutions seem far more realistic, although [America’s corporate-owned politicians](#) cannot be counted on to lead the effort, or even help it much. They may be virtually forced to ratify the inevitable, but they are far greater obstacles to needed change than leaders of it. They sold their souls a long time ago, and many of them do not even realize it.

This site’s racketeering essays have made the case that most the United States economy is a tremendous waste of time by most of the people involved. Tomorrow, 95% of the doctors, lawyers, politicians, accountants, soldiers, journalists and corporate executives could be relocated to the moon, and American society would be better off. Industries such as [energy](#), [transportation](#), [agribusiness](#) and the [military](#) are destroying this planet, for a very short-lived “benefit,” if any. Not only are those professions and industries largely worthless, they have held back humanity from true progress as they protected their turf. All that racketeering is the primary reason why the American standard of living has been declining for a generation.

The primary purpose of this site, however, is showing that we [can have a completely healed humanity and planet](#), and soon, if we *care*. Our fate rests in *our* hands.

Insurance Handbook, p. 58 and Dacey, Norman F. *What's Wrong with Your Life Insurance*. pp. 400-401.

[8] Joseph Stiglitz was the World Bank's chief economist. Before the World Trade Center attacks, he came forward with information confirming the exact scenario I am painting here. Stiglitz was involved with the neocolonial raping of post-Cold-War Russia, selling off state assets at fire sale prices to corporations. See Gregory Palast's "Four Steps to IMF Damnation," published on August 23, 2001, by [ZNet](#).

[9] See Brad Knickerbocker's "Where America Stands Among World Empires," *Christian Science Monitor*, December 29, 1999. Jimmy Carter said regarding U.S. foreign aid to poor nations, "We are the stingiest nation of all." The world's richest nations (the West and Japan) formed the Organization of Economic Cooperation and Development (OECD). Official Development Assistance (ODA) is given to poor nations by the rich ones. The United Nations set a target of 0.7% of Gross Domestic Product (GDP) of ODA for the OECD nations. U.S. aid has continually shrunk since the Cold War ended, and in 1999, of the 22 nations in OECD, the United States ranked dead last in percent of GDP for its ODA, at 0.1%. Few nations met the 0.7% goal, and the median was about 0.3%. The United States was a third of the median. It is even worse than that, because most of the "aid" that the United States gives is tied to U.S. business deals, where the "aid" is more to gain market penetration for U.S.-based corporations or other corporate benefit. In reality, almost no American "aid" benefits the world's poor, and in fact it usually makes their plight worse, with military aid propping up some of the most brutal regimes on earth.

Julian Simon, Whaling and the "Good News"

By Wade Frazier

[Julian Simon and *The State of Humanity*](#)

[Preindustrial Whaling and the Good News](#)

[Modern Whaling](#)

[Footnotes](#)

Julian Simon and *The State of Humanity*

Julian Simon was a conservative economist whose life purpose appeared to be trumpeting the world's "good news," and how humanity was increasingly better off. His magnum opus, *The State of Humanity*, appears to be a conscious pun on the Worldwatch Institute's annually published *The State of the World*. Whereas *The State of the World*, is usually, though not always, alarming reading regarding global trends, *The State of Humanity* seems to be a conscious counterweight to that mentality.

Julian Simon was a prominent media figure in the late 1990s, with his message of "good news" and everything getting better. *The State of Humanity* consists of 58 chapters from various experts regarding issues such as economics, agriculture, natural resources, pollution, and slavery, crime and other social issues.

As I looked at the book's table of contents, I recognized some of the experts' names. At least some of them are establishment ideologues. Under a heading of "Can All This Good News be True?" Simon stated, "But what about the other side's data? There are no other data."[\[1\]](#) I read books by the experts who wrote the "good news," and researched several areas much deeper. The more I read and researched, the angrier I became.

Elizabeth Whelan wrote the book's only chapter on general chemical pollution. Today, the United States produces hundreds of millions of tons of hazardous waste each year (hundreds of times more than it produced in the 1940s), which is far more than half of the world's hazardous waste production. I had

seen Whelan's name before. I read five of her books, while looking at other sources of information about her. Her co-author for some books was Frederick Stare, who founded the Harvard Department of Nutrition. Stare was a prominent nutritional expert for many years in America, with a regular newspaper column in over 100 American newspapers. Here is some of the advice he regularly provided in his columns and other publications.

"In the feeding of hospital patients, more attention should be given to providing tasty and attractive meals, and less on the nutritive quality of the food."

"People say that all you get out of sugar is calories, no nutrients.... There is no perfect food, not even mother's milk."

"Have confidence in America's food industry. It deserves it."[\[2\]](#)

"There is no convincing evidence that in the average American diet decreasing the intake of sweets will lessen tooth decay."

"Sugar is a quick energy food and pleasant to take. Sugar does not contain any appreciable amounts of vitamins and minerals, furnishing calories only. Even people on a severe reduction diet can afford to put a teaspoonful of sugar in their coffee or tea three or four times a day."

"Those who speak with disdain of the empty calories of sugar or fat in processed foods as though they were a blight are also doing a fair share of exaggeration. The empty calories of sugar and fat have always been important to any normal, well-balanced, nutritious diet and add taste, zest and pleasure to a meal."[\[3\]](#)

Here is my favorite Stare quote:

"...those who proclaim that 'natural vitamins' are better than 'synthetic vitamins' are just plain stupid."[\[4\]](#)

Stare's advice became infamous in numerous circles for its disinformational and anti-nutritional agenda. Those quotes I found in my library at home. There is always a risk of being quoted out of context, so I read two books that Stare and Whelan co-authored, *Panic in the Pantry* and *Balanced Nutrition: Beyond the Cholesterol Scare*. Stare was not taken out of context. His quotes deserved exclamation points behind them. Whelan was a student of Stare's at Harvard, and is his professional descendant. I read three other books Whelan authored by herself: *Preventing Cancer*, *A Smoking Gun: How the Tobacco*

Industry gets away with Murder, and Toxic Terror.

In all five books, the authors question the motivation of health activists who did not toe the agribusiness/USDA/chemical company/food processor party line. Anybody who disagreed with the voices of authority on issues of nutrition and health were attacked, sometimes very mean-spiritedly, and their integrity and motivation was called into question, suggesting that their activism was motivated by cashing in on their nutritional answer. In *A Smoking Gun*, Whelan suggested that Ralph Nader was in the pay of the tobacco companies, taking it easy on them while attacking other enemies of public health.

Stare's Department of Nutrition at Harvard has long been bankrolled by the food processing companies, and his department kept producing "research" that showed how nutritious processed food was. Stare became a favorite hired gun of the food processing companies. In 1970, there was a scandal around the nutritional quality, or lack thereof, of breakfast cereal. A Consumer Subcommittee of the Senate Commerce Committee convened to examine the issue. Stare testified as an expert witness. He admittedly attended the hearings at "the request of Kellogg Company and the National Biscuit Company." During the hearing, it came out that four percent of his Department of Nutrition budget was provided by the cereal industry. That led one newspaper to drop his national column, apologizing into its readers "for presenting the views of one who was not as unattached as we thought or wanted him to be."[\[5\]](#)

Whelan is Stare's professional descendant in more ways than one. Many years ago she founded, and ever since has been the president of, the American Council on Science and Health (ACSH). Her position at ACSH earns her more than \$200,000 per year. In 1985, she published her magnum opus, *Toxic Terror*. In *Toxic Terror*, she again questioned the motivation of anybody who fought the proliferation of corporate chemicals. She also wrote proudly of her motivation for writing *Toxic Terror*, as a "concerned American citizen, taxpayer, wife and mother."[\[6\]](#) In *Toxic Terror*, Whelan defended DDT, Nuclear Energy, PCBs, PBBs, formaldehyde, dioxin, and pesticides. Her defenses of chemical poisons and nuclear energy did not impress me, and I spent many days researching her work in *Toxic Terror*.

In 1989, a few years after *Toxic Terror* was published, Whelan attacked the Natural Resources Defense Council ([NRDC](#)) for publicizing scientific research showing that Alar was potentially harmful, especially to children. Alar was a chemical used to keep ripening apples on the tree until harvest time. Scientific research was showing that Alar was carcinogenic, and the EPA was already moving to ban it when the NRDC began a campaign to make it a public issue. The Alar issue became a parable of corporate chemicals and the ferment around their use, and Whelan and her ACSH led the attack on the NRDC and others against Alar.[\[7\]](#)

The next year, Howard Kurtz of the *Washington Post*, writing for the *Columbia Journalism Review*, gave Whelan's "selfless attacks" on all those "self-serving" environmental and health activists a near-fatal blow by an article published in March 1990. In the article, Kurtz contrasted Whelan and ACSH's stands on various foods and chemicals with those who funded her organization. Kurtz wrote that the maker of Alar, Uniroyal Chemical Company, donated at least \$25,000 to ACSH. Kurtz pointed out numerous other questionable stands that Whelan and ACSH took. Whelan defended the nutritional properties of fast food while getting money from Burger King. Whelan openly questioned the link between high dietary fat and disease while taking money from Oscar Meyer, Frito Lay, Hershey Food Fund and Land O'Lakes. Whelan defended saccharine and received money from Coca-Cola, Pepsi, NutraSweet and the National Soft Drink Association. Whelan defended pesticides while receiving "donations" from pesticide makers. Kurtz presented other instances of Whelan's conflict of interest, such as defending hormones in cows

while receiving money from the National Dairy Council and the American Meat Institute. He concluded his article with, "Perhaps it would be best to say that she enthusiastically embraces the chemicals-are-safe philosophy of those who happen to support her financially. People ought to know that so they can digest her views with whatever grains of salt they deem necessary."

How did Whelan react to such a scandalous disclosure? In 1990, the ACSH stopped publishing its funding sources.^[8] That in itself was somewhat strange, as in Kurtz' article, Whelan was quoted as saying, "I'm very proud of my corporations. I put their names all over my literature." Not anymore. Hit the ACSH web site today and try finding the names of its corporate sponsors. Whelan's and Stare's repeated attacks were shocking enough, but their hypocrisy was astounding.

Whelan's attacks on Ralph Nader's funding and the motivation of others appear a tad disingenuous, something that Kurtz reported on. Yes, some of the money that funded the Nader-inspired Center for Science in the Public Interest came from tobacco heirs; people who inherited tobacco fortunes handed down for generations, and were donating some of it to "liberal" causes. That is very different from Whelan getting money directly from corporations (or "foundations" that they fund) whose products she defends.

Whelan, to her credit, hit the nail on the head in defending herself. She said,

"Everyone is funded by someone...if you consider the possibility that we do believe in what we are doing - it is wrong to terrify people about trace levels of chemicals that cause cancer in mice - where would you get the money? Where would such money come from that would not be tainted?"

How about from the public that you say you are protecting, not the corporations who produce those chemicals? The funding issue is corrupting, and every organization faces it, whether it is idealistic or not. Instead of challenging a system that makes prostitutes out of folks such as Whelan, Whelan is at the head of the line with her hand out.

On the ACSH web site today, they state the position that is also discussed in Kurtz' article, which is that ACSH is "independent." Whelan presents herself as the heroine, standing up to her corporate donors when they try telling her what to write. It seems that many of her corporate donors have made the mistake of assuming that Whelan and ACSH are there to follow their orders. When they try giving Whelan her marching orders, she tells them quite righteously that they are not that kind of organization. Whelan's attitude is something that Noam Chomsky and others remark on about the mainstream media. When responding to the devastating charges of [Manufacturing Consent](#), media personnel have protested that they never get a call from the Pentagon or the corporate boardroom, telling them what to write. Their defense betrays simplistic thinking. As Chomsky and others point out, the system works far more subtly than that. The way that the media, and *any* institution works, is that those who absorb the indoctrination become cogs in the machine. Those who do not absorb the indoctrination, failing to believe the "right" way, do not rise through the ranks. Institutions are not consciously self-destructive. People who challenge the basic tenets of the institution are weeded out in one way or another.

Journalists and investigators who challenge large corporations or other powerful organizations will find

themselves under attack. Sometimes, they die suddenly and mysteriously, as [Danny Casolaro](#) and [Paul Wilcher](#) did. More commonly, their careers are scuttled, as what happened to [Peter Arnett](#), [April Oliver](#), [Jack Smith](#), [Gary Webb](#), [Ray Bonner](#) and [others](#).

In the mainstream media, when journalists step out of line and challenge the powerful, their careers are quickly over. Conversely, if they behave themselves, reporting as the powerful want them to, they can count on a successful career. They may not be too consciously aware of the fate of their power-challenging brethren, or have rationalized it as some ethical breach that they made. If they are typical members of the herd, they internalize the values they have been taught ([such as mainstream oncologists believing in chemotherapy, for instance](#)), and feel they are acting freely as they report their stories (or oncologists thinking that they are saving lives). They respond indignantly to the nearly unanswerable scholarship of Herman and Chomsky in *Manufacturing Consent* with "Nobody tells me what to write!" Not only are there rewards for playing the game properly, there are dire penalties for those who do not. As [Dennis Lee](#) once told me, put a man in a big enough cage, and he thinks he is free.

Whelan's corporate donors do not fund her because they believe in their noble mission. They pay her because of the great propaganda that she provides. Whelan apparently thinks that her organization is a charity. She is her sponsors' "independent" attack dog. If Whelan ever stepped on her sponsors' toes, the money would stop flowing, and she and everybody else knows it. How "independent" is that?

One of her pro-corporate comrades in arms even claimed that she never met a chemical she did not like. [\[9\]](#) Whelan's anti-tobacco stand is probably a smokescreen, attacking the world's most obvious health hazard so she could appear to be a true health activist, while defending the far more insidious threats to our health, and being nicely paid to do it.

Whelan's organization deserves to become widely known as the corporate mouthpiece it is. At the time I was writing the first draft of this essay, Whelan made the front page by attacking a doctor's book that states that women can prevent breast cancer with dietary measures.[\[10\]](#) Whelan even went further than *Toxic Terror* in *The State of Humanity* by also defending [Bovine Growth Hormone](#), [food irradiation](#), aspartame and [fluoride](#).

Other contributors to *The State of Humanity* had similar conflicts of interest.[\[11\]](#) In the data that Simon's authors presented, they played the numbers game to the extreme. The book is nearly a proof of Benjamin Disraeli's quote, "There are three kinds of lies: lies, damned lies and statistics."

For one example of the many statistical games played in *The State of Humanity*, chapter 26, "The Recent US Economy" by Alan Reynolds will serve. Although productivity in America has been barreling right along, meaning that the average American worker produces more per hour of time producing it[\[12\]](#), the real wage per hour has declined for a generation. It went from a peak in 1973 of \$13.40 (in 1997 dollars) to \$12.09 in 1992 (the last year covered in Reynolds' chapter), as American jobs have been shipped abroad to nations [that enslave their populations](#) (mainly U.S. client states), for a decline of nearly 10%. [\[13\]](#) Real wages per hour has been the standard measure of worker income for many years. It is the most equitable measure of worker income, and one of the best standard-of-living measures, something acknowledged by nearly everybody involved. Although Reynolds discussed productivity increases in output *per hour*, even writing about how "impressive" it was, he does not mention the trend in wages *per hour*. Placing those trends side-by-side would collapse his arguments.

Reynolds cleverly misdirected his readers by presenting other statistics. He abandoned real wages per hour to pursue another statistic more to his liking. He presented a measure known as family income. Why does he do that? There are obvious reasons. If a breadwinner's (assume a man here, which is the most common case) wages have declined, but he is able to make up that decline by working overtime and having his wife forced into the labor marketplace (and increasing child labor), then family income can increase. The family works more hours to maintain its standard of living, and a large piece of that increasing "family income" pays for day care, while the mother works outside the home and the father works overtime. That situation is accelerating the American family's disintegration, and creates lifelong pathologies in children raised in that environment, and somehow Reynolds transformed that into "good news." On the issue of wealth, it is well known that nearly the entire increase in national wealth during the 1980s went to the rich.[\[14\]](#) Reynolds preferred to ignore the increase in wealth disparity in America, and instead focused on statistics showing that total national wealth increased. Reynold's chapter was an impressive example of a statistical manipulator at work, transforming dire statistics for average Americans into "good news."

Another expert who wrote two chapters in *The State of Humanity* was Bernard Cohen, who may be the world's biggest cheerleader for nuclear power. His chapters discuss how safe and economical nuclear power is. Cohen made himself famous by offering to eat plutonium to demonstrate how relatively harmless it is. I devoted weeks to researching Cohen's work, and had a head start there, riding in the saddle with Dennis Lee and having to become better informed about nuclear waste to speak at [DOE hearings](#). Will declassified documents in the year 2050 show that Cohen's mission was similar to [Harold Hodge's](#)?

As I read other chapters in *The State of Humanity*, and researched their subjects deeper, the picture became clearer. Simon was scouring the academic waters for the most extreme pro-corporate positions he could find. Presenting Whelan as his sole expert on chemical pollution made the ideological nature of *The State of Humanity* quite plain. For Simon to state that his stable of authors presents the only data existing regarding the issues he presents is stupefying. If Simon's work is not a conscious fraud, it is a stunning example of how deluded an ideologue can get.

Another prominent corporate mouthpiece, who appears to be aspiring to succeed Simon (Simon died in 1998) as a "good news" voice of corporate America is Steve Milloy. [Milloy](#) publishes a vitriolic "Junk Science" Home Page on the Internet. Milloy is similar to Whelan, with a corporate-funded Astroturf organization. Through litigation, it has come to light that Philip Morris funded Milloy's work, even creating his "sound science" organization in order to try derailing the science that shows how harmful second-hand cigarette smoke is. Tobacco interests, polluters and those selling unhealthy products have paid Milloy handsomely for providing his disinformation. The Cato Institute, which avidly promoted Simon's work (Simon was an "adjunct scholar" to Cato), is now promoting Milloy as its new "good news" advocate.[\[15\]](#) Fittingly, a tobacco company shall succeed Simon at Cato.

Instead of presenting a chapter analyzing *The State of Humanity*, this essay will present one of the many detours taken while researching his book. Simon was a capitalistic cheerleader. On page 25 of *The State of Humanity*, Simon rhapsodized about the first oil well, drilled by Drake in 1859 in Pennsylvania, which led to solving the "whale oil crisis." It was a "three cheers for the oil industry" piece. Other work by Simon, whose attitude is reflected in the book's title, demonstrated that he was staunchly anthropocentric, relegating all other species to a service role to humanity, their right to exist only seen in terms of how they

benefit us. When I saw his acclamation for the oil industry and how it dropped the "bottom out of the whale oil market," I read a few books on whaling.

Simon was one of the establishment's intellectual warriors. Whether those warriors are "experts" on [Nightline](#), pro-establishment op ed columnists in the newspapers, university professors and scientists who also consult for corporations, producing scientific arguments and data that "coincidentally" serves the interests of their benefactors, or they run "[Astroturf](#)" fake grassroots organizations that advocate corporate positions from an "independent" activist perspective, or they are "[skeptics](#)" who attack anything not following the scientific establishment's party line, they have usually prostituted themselves. Purveying elite propaganda has its benefits, and it pays well. Among their duties are producing disinformation that helps keep the masses dazed and confused, by presenting views and data that serve the dominant class' interests.

Preindustrial Whaling and the Good News

Simon's "good news" spurred me to obtain a few books on whaling, and although mainly written by pro-whalers, the stories were grim, although the authors did not mean them that way. Simon's focus was on how heroic the petroleum entrepreneurs were, but he ignored [John Rockefeller](#) and the price the *whales* were paying for whale oil.

Aboriginal people have hunted whales since prehistoric times, and the European-dominated commercial phase of whaling began nearly a thousand years ago. The Mediterranean cultures, the Roman Empire most prominently, hunted whales to extinction in the Mediterranean by 500 AD. Hundreds of years later, the Basques began whaling commercially in the Bay of Biscay, between France and Spain. In a few centuries they had "whaled out" the bay. It is also surmised that whales became scarce in the Bay of Biscay because whales began avoiding it. By the 1500s, new whaling grounds were sought, and because Europeans were [learning how to sail the seas and conquer the world](#), new grounds were discovered in Iceland, Newfoundland, and north of Norway, at Spitsbergen. The Spitsbergen whaling grounds were discovered in 1596, and were soon swarming with the usual suspects of European domination: the Dutch, English, French, German and Danish. The experienced Basques originally manned the harpoons in all fleets, however.

All the "great whales" except one, the sperm whale, are called "baleen" whales. Baleen is a sieve in whales' mouths that strains their food from the oceans, usually composed of small shrimp, fish and microscopic life. That food, called krill, plankton and other names, is plentiful in the oceans near the poles, which are primary feeding grounds for baleen whales. At Spitsbergen, the favored catch was called the right whale. It and similar species variations in northern waters went by names such as Greenland and bowhead whales. The term "right" came from seamen picking the "right" whale out of a herd to kill. Right whales were coveted for their ease of killing, the fact that they floated when dead, their high oil yield and their baleen bones (called whalebone), used for women's fashion, fishing rods, chair seats, etc. Whales became one more short-lived [energy resource](#) for humans.

The whalers at Spitsbergen made it big, and whaling became a major industry. By about 1637, the Dutch had more than three hundred ships at Spitsbergen and 18,000 men, all cashing in on the "whale rush."

The [incessant European wars](#) interrupted the frenzy at times, but in 1719 the Dutch began sailing past Greenland to the Davis Straits, as the European side of the Atlantic was “whaled out.”[\[16\]](#) Before long, the English colony of Massachusetts joined the whaling boom.

In the early days of Europe's invasion of North America, whales were plentiful. One could stand on the seashore and watch whales swim past in endless procession. The natives sometimes fished for whales, and used drugged harpoons to kill them. It is said they taught the Europeans how to whale in the native style, and as the Europeans were annihilating the natives they began an epoch of whaling that became a big part of the New England economy...for a while. As with [bison skinners](#), [passenger pigeon](#) hunters, [Midwest loggers](#) and [Indian fighters](#), whaling lasted while the whales did.

At first, the industry consisted of scavenging whales that washed ashore. Then, as they saw money in it, they sent small boats from shore to kill the whales swimming by, and the industry was off and running. In a celebrated case in 1672, a right whale swam into Nantucket harbor, lazily swimming around and spouting off for a few days. It did not take long for a few enterprising residents to make a harpoon, set out in a small boat and kill the whale. Nantucket's future was thereby sealed: it became America's first whaling center.

The New England shore was quickly “whaled out.” Yankee ingenuity and cupidity would not be thwarted that easily. Bigger boats were built to go farther to kill the increasingly scarce whales. The European and American fleets converged on the Davis Straits near Greenland. In 1737, there were about sixty American whaling ships in the Davis Straits, competing with the Europeans. It was not long before the Davis Straits was “whaled out,” and new grounds were sought. Many thousands of whales were being killed for their oil and fashionable bone.

As each area was whaled out, new places were sought and the “whale rush” continued. Baffin Bay, the Grand Banks, the Saint Lawrence Gulf and vicinities were all opened to whaling operations during those easy whaling days of pre-Revolutionary America. As the North Atlantic was being whaled out, new grounds were sought to keep the industry going, and soon fleets were sailing to Africa, the Caribbean and South America in search of whales.

In pre-Revolutionary America, a new chapter in whaling unfolded. In the early 1700's, the high quality (and quantity) of oil that could be obtained from sperm whales was noted, and that, combined with the increasing scarcity of the easy-to-kill right whales, created the sperm whale boom. There was a major problem with sperm whales however: they were the only predatory great whales. The right whales were docile creatures, as are most baleen whales, and barely struggled when killed. The sperm whale, on the other hand, was a predator and knew how to fight back. The quest for sperm whales made whaling dangerous. Sperm whales regularly crushed (sometimes in their mouths) the small whaling skiffs that went after them, and they rammed and sank a number of big whaling ships. Sperm whale oil, and the valuable ambergris in their intestines, made it worth it. America's underclass, newly freed slaves and others at the lowest rungs of society, manned the whaling parties, as the poor always do this world's dangerous work. That era of whaling inspired *Moby Dick*.

During the [American Revolution](#), the British easily captured almost all of America's whaling fleet, and the crews were impressed into British service...as whalers. Those captured Americans kept whaling during the Revolutionary War, but for King George, and the whales' decimation continued. After the Revolutionary War, New Bedford, Massachusetts became the new capital of whaling. The British

destroyed America's whaling fleet in the War of 1812, but it barely slowed the industry. Whaling boats were made bigger and bigger to go farther and farther to catch the increasingly elusive whale. The typical whaling pattern was to find virgin seas where whales were, then the world's whaling fleets would descend upon the area, whaling until the whales were gone. It became a global whale rush. Virginal whaling grounds found and the year of their opening were: Brazil Banks, 1774; Madagascar, 1789; Chile, 1790; offshore Chile in mid-pacific, 1818; Japan, 1820; Zanzibar, 1828; Kodiak, 1835; Kamchatka, 1843; Okhotsk Sea, 1847, Bering Sea and Arctic Ocean, 1848.[\[17\]](#) The world was being scoured of whales. In the Arctic, the whalers supplemented their catch by killing as many polar bears, walruses and seals as they could.[\[18\]](#)

American whaling's peak volume year was 1847, and then the decline began. Whaling expeditions went from being done from the Massachusetts shoreline in rowboats, to global expeditions. In 1846, there were 736 American whaling ships on the water, three quarters of the world's fleet, and the average time at sea for a whaling expedition was approaching three years. *Moby Dick* was published in 1851. In a telling insight into the whaling crews' mentality and general attitude of the times, in 1849 the Pacific whaling fleet was "crippled" when [gold was discovered in California](#), because the crews deserted ship in San Francisco and swarmed into the gold fields.[\[19\]](#)

The sailors were often involuntary. In port towns, unscrupulous innkeepers would allow a man to run up a tab, then one day the man was made quite drunk. When he sobered up, he found himself at sea on a whaling ship. The innkeeper got a nice commission from the whaling ship, and the hapless boarder became a prisoner-whaler. Other ruses got men aboard, as whaling was one of the most disreputable professions around, and it was dangerous, hard, low-paying work.[\[20\]](#)

In 1846, the same year America [began its theft of several western states from Mexico](#), the whalers showed up on California's coast. The gray whale migrated up and down North America's West Coast, and whalers killed them enthusiastically. Whaling in the shallow lagoons and bays of Baja California was dangerous work because the gray whale often fought back, earning it the name "devil-fish." One technique to safely kill a gray whale was harpooning a whale calf and tethering it offshore, shooting the mother as it tried aiding its calf. Within a generation, gray whales were more than 90% exterminated, and they were thought to be extinct by 1900.[\[21\]](#) The gray whale tale is one of the few stories with a happy ending, so far. During the 20th century, they recovered to their pre-holocaust numbers.

During those glory days that Simon wrote about, when [Drake drilled his oil well in 1859](#), and how there were hundreds of small refiners in America by the 1860s, whaling was already declining. The [Civil War](#) dealt the industry a heavy blow, as more than 100 whaling ships were lost, mostly by high seas piracy by the rebels of the South. *The Shenendoah* dealt the Pacific whaling fleet another crippling blow when it burned and sank most of the Arctic fleet. With declining supply due to the decimated whale population, and fewer ships on the water, and the increasing demand for oil as [America rapidly industrialized](#), yes, the "market" was ripe for petroleum. Oil became the next gold rush, except that gold was black.

Modern Whaling

In 1865, Svend Foyn perfected a method of whaling that had frustrated American and European inventors for generations: an easier way of harpooning and killing whales. A Norwegian, Foyn perfected a gun-propelled, explosive harpoon. His method ushered in the era of "modern" whaling.^[22] Foyn's method quickly took over the industry, and whaling became industrialized. The previous centuries of sailboats and strong harpoon arms paled next to steam-driven ships with explosive harpoons shot from cannons. Whales were then driven rapidly to extinction. With the rise of the petroleum industry and the increasing scarcity of whales, the New England whaling industry collapsed as whaling entrepreneurs rapidly fled the business. Europe did not have the U.S.' vast oil deposits.

While the American whaling industry was collapsing, European whaling entered a new era. Until Foyn's innovation, whalers could not profitably kill a class of whale known as rorquals. Rorquals were much faster swimmers than the easy-to-kill right whale, and they sank when killed. Rorquals were not hunted commercially until the innovations of explosive, gun-propelled harpoons, heavy harpoon lines to keep the whales from sinking, and faster, steam driven boats. Rorqual whales include: blue, fin, sei and humpback whales. The modern age of whaling was born.

The right whale and related species had already been hunted to the brink of extinction. In the Northeast Atlantic, the right whale was considered extinct around 1900. Even today, there are a few thousand surviving globally, at best, after a century of recovery. The typical extermination rate of the great whale species was more than 95%, similar to the decimation rates that native peoples endured due to the world's conquest by Europe.

With the industrialization of whaling the slaughter took place in earnest, although the United States was by that time largely out of the business, as old-style whaling was as dead as the herds of easily killed whales that sustained it. Norway, Japan, Britain and Russia got heavily into the business at one time or another. The Norwegians dominated for fifty years, to eventually leave the business. At the end, only Japan and the Soviet Union were doing much commercial whaling.

The northern oceans were quickly shorn of rorquals. By the early years of the 20th century, only one place had not been pillaged by the whalers: the remote and harsh waters surrounding Antarctica. Centuries of whaling the northern waters made those whales nearly extinct, but the southern waters were ripe for exploitation. The great blue whale lived there by the hundreds of thousands, eating the rich krill. The blue whale is the largest animal earth has ever seen, attaining a length of more than one hundred feet and weighing up to 400,000 pounds. Dinosaurs did not get that big. The Antarctic blue whale became the mother lode of whaling. The modern whaling industry measured all whales by the Blue Whale Unit.

Plundering the Antarctic while scouring the whales' migratory routes along South America, Australia and elsewhere was lucrative while it lasted. *The History of Modern Whaling*, largely written in the 1960s by Norwegians, is a pro-whaling book. The authors' excitement for whaling is evident, but even they have many somber recollections regarding the twentieth century history of whaling, ending with the collapse of commercial whaling during the 1960's, because there were no more whales left to kill. The great blue whale population had been reduced to fewer than 1000 creatures when whaling finally ceased.

The History of Modern Whaling recounts the International Whaling Commission's gyrations during the 1960s (when the whale populations were nearly extinct) and the political maneuvering by the Japanese and Soviets to kill that last whale. The Japanese and Soviets kept lamenting the economic impact of

reducing the whaling quotas. The Japanese capitalized on an apparent species distinction between blue whales and a "new" species they had "discovered," the pygmy blue whale. The pygmy blue whale became a separate species in Japan's eyes, thereby circumventing the quotas.[\[23\]](#) The pygmy blue whale is considered a separate species today, about half of the surviving blue whales. The great blue whale population is a few thousand today, about two percent of its population before the short-lived modern whaling era. As Simon celebrated, humankind is clever and can "substitute" one thing for another when it becomes scarce. As the blue whales were being exterminated (skimming the cream), industrialized whaling also decimated the fin, sei, and humpback whale populations, and the industry eventually stooped to hunt the "tiny" minke whale.

In *The History of Modern Whaling* the authors repeatedly summarized the industry's state, off the African shore for instance, and told how the area was swept free of whales, the industry collapsing there. The whaling nations would point fingers at each other, and the area would be left alone for a decade or two. Then hunting would resume, and within a year the area would be wiped clean again. Not only were the numbers collapsing, but also the whaling phenomenon was similar to the logging situation here in the Pacific Northwest: the first killers on the scene chopped down or harpooned the really big ones. The size of whales caught continued declining, as younger and younger whales were killed.

The sperm whale is the only great whale not nearly eradicated by the whaling industry. Whalers killed a million sperm whales, but two million are estimated alive today. The author of *The Yankee Whaler* noted that sperm whale teeth kept by old sea captains were relics of the good old days, when one whale could yield well over a hundred barrels of oil. The record sperm whale tooth weighed over four pounds. The author noted that the teeth never got over two pounds anymore, and that book was written in the 1920s. The author estimated that not only were the big whales killed long ago, but the sperm whale herds were 90% decimated in his time, judging by how long it took to fill the ship's hold with whale oil.[\[24\]](#)

In another case of economic efficiency, the whale killers became more economical. The Japanese used most of the whale. Japanese people had a yen for whale meat, and meat that had spoiled was used for pet food.[\[25\]](#) In the good old days, particularly with sperm whales, the head was chopped off and the rest of the carcass dumped back into the ocean. That is similar to when the "pioneers" of America's Great Plains [killed bison](#), only removing their tongues if they took anything at all, since millions of those kills were "for sport," often shot from the passing train's windows.

That situation is similar to the practice of "finning" sharks (for shark-fin soup), which is still happening as sharks are hauled out of the ocean, their fins cut off, and then thrown back to die. American fishermen are major offenders. Those practices are driving species to extinction, as fish populations are collapsing globally due to over-fishing, finning, etc. Sharks are becoming threatened with extinction. The situation is becoming so dire that *Time* magazine made it its cover story.[\[26\]](#) Good news cheerleaders can call *Time* magazine a "prophet of doom," but the mainstream media has covered up far more industrial problems than it has exposed them. When *Time* magazine finally wakes up and begins covering it, the environmentalists have been calling attention to it for years.

There are many distressing footnotes to the whaling situation. One is the collapse of the Soviet Empire and many things becoming known which were kept hidden by the Communist rulers. It has been admitted that the Soviet whale catch data from 1947 to 1972 was significantly falsified. In 1996, Dr. Alexey Yablokov, Environmental Advisor to Boris Yeltsin, submitted data to the International Whaling Commission showing that the actual Soviet Antarctic whaling catch was 74% above that reported. The

man who cleaned up Chernobyl and spoke out about it, Dr. Vladmir Chernousenko, has been charged with revealing state secrets, as has Yablokov.[\[27\]](#)

In what is probably the greatest tragedy of all, whales are likely a sentient species. "Sentient" means they have attained the level of whatever humans have that makes us able to learn math, create language, and philosophize. What sets human beings apart from all other species, biologically, and is credited with our "[ascent](#)," is the human brain (and to a lesser extent, our thumbs). We have the largest, most sophisticated and complex brains on earth...almost. Elephants, whales and some dolphins have bigger brains, and the bottle-nosed dolphin's brain is *relatively* larger than ours. We do not have the planet's biggest brains. In light of that fact, experts have stated that having a bigger brain than us may not mean much, and that it does not necessarily make them smarter or "better." That reflects the anthropocentric attitude that the West has held for millennia. At least the West is becoming aware of the cetaceans' potential sentience, although for many years America killed an *average* of 200,000 dolphins a year in its tuna nets. There really is "good news" there: the dolphin kill is now only a few thousand per year to supply America with its tuna, due to dolphin advocacy by a relatively courageous few, those "hysterical" and "self-serving" environmentalists that Elizabeth Whelan and others deride.

Scientists today study dolphins and whales, to a degree, and announce that they sure seem smart, smarter than dogs even. Of course, the American military is investigating how cetacean intelligence can be exploited, turning the few surviving whales into aquatic soldiers, helping keep the world "free." Few scientists have hinted that cetaceans might be smarter than human beings. After all, to borrow a favorite American saying, "If they were so smart, they would be rich!"

Spiritual literature has discussed the sentience of whales and dolphins for many years, stating that they are essentially water people. In an order of magnitude or two beyond the European inability to understand the mind and culture of Native Americans, understanding the way cetaceans think is apparently far, far beyond the capability of our scientists. Cetaceans have evolved in another realm from humans, with no obvious way to manipulate their environment, living in water, etc. We know so little about intelligence itself that statements about them not being as "intelligent" as we are demonstrates the standard Western arrogance. The spiritual literature says that whales think holographically, something linear-thinkers cannot fathom. That would be similar to describing a three dimensional world to a two dimensional person, as in the famous story of the [flatlander A. Square](#), a two-dimensional being, meeting a three-dimensional being from "Spaceland." Mr. Square could not fathom its three-dimensional existence, in a tale written more than a hundred years ago.[\[28\]](#)

Nobody needs to settle for abstract mystical concepts about their sentience and ensoulment. There are many first-person accounts of cetacean intelligence and ensoulment. An argument about ensoulment and cetaceans is pointless with most scientists, because they do not believe that *human beings* are ensouled. In the "scientific" worldview purveyed by [Carl Sagan](#) and friends, humans are bags of chemicals, reacting in unusual and mysterious ways. The mystery of life is a mystery of chemistry to many scientists, and is the scientific establishment's prevailing view today.

Timothy Wylie's amazing account in *Dolphins, Extraterrestrials and Angels* tells a different story. He went to Florida and spent days swimming with a school of dolphins. He did not merely hang out, he had some specific questions, such as: "How do dolphins deal with violence and depredation? How does a complex and sophisticated society sustain a sense of community without apparent instrumentation, artifacts or extra-somatic memory systems (books and the like)? And since UFOs consistently have been

reported entering our oceans, have the dolphins had any contact with them?"[29]

During his stay, all his questions were answered, although he never voiced them aloud. Some questions were answered in spectacular fashion. Wyllie was treated to a private UFO show. Others were answered so remarkably and on the dolphins' terms that Wyllie realized they thought very differently from humans. His testimony is reminiscent of [UFO contactee reports](#), where their questions were answered in a way that made them question the nature of their own minds. They realized that their questions did not necessarily mean much to somebody who thought quite differently. The extraterrestrials' answers make us question how we form our questions, and how we order our minds. Wyllie wrapped up his visit with a spectacular encounter with the dolphins. They deceived him as they encouraged him to shed his mind's preconceptions, and his friends were able to witness the dolphins' gentle friendship, giving "third party" verification of what Wyllie did not even know was happening at the time.

[Michael Roads](#) had an awesome encounter with dolphins at the famed Monkey Mia beach at Shark Bay in Australia, in his book *Journey into Nature*. Again, in his encounter, the dolphins answered his questions in a decidedly non-human and experiential way, and they reinforced their difference from humans in how they approached life, and made clear the equal divinity of humans and dolphins.

People can such testimony *a priori* because it is "anecdotal," "unscientific" and they were not there to see it themselves, and it was "probably fraudulent or imaginary anyway," whatever "imaginary" means. No professional skeptic had actually *tried to have* an experience like Roads' or Wyllie's for themselves. They are more interested in invalidating the experiences of others.

The state of mind allowing such a contact with dolphins also required a particular flexibility of consciousness; the kind that professional skeptics probably cannot muster. Nothing is keeping *you* from seeking out experiences similar to what Wyllie and Roads had.

The cetaceans have apparently forgiven us for our genocide. It is interesting that many humans are beginning to wonder if cetaceans are ensouled, and that is a new and exciting idea, justifiably so. My spiritual literature says that cetaceans are beginning to wonder the same thing *about us*. All they had experienced for centuries was the genocide of their kind, and they did not think that a sentient species could create such mindless destruction.

One need not wax mystical to gain an appreciation of the situation. It is not much of a stretch at all, in light of current scientific understanding, to consider that cetaceans may be sentient, with awareness much like ours, without opposable thumbs. Imagine if an alien race invaded earth and killed 98% of us because some bones in our heads made a nice fashion statement, and our flesh was tasty and useful for one of their new industries. That is close to what the whales have experienced.

[11] For instance, Fred Singer is a leading scientist who downplays the notion of [global warming](#), and has consulted for several oil companies, making big money. Singer authored chapter 48 of *The State of Humanity*, titled "Stratospheric Ozone: Science and Policy." Singer was against banning chloro-fluorocarbons (CFCs), and stated that the chemical companies were forced to stop CFC production unfairly. Patrick Michaels is another prominent scientist who downplays global warming, who also makes big money consulting for coal companies and other energy interests, and works for the anti-environmental Cato Institute. (they sold me *The State of Humanity*. I bought many Cato books, studying their brand of scholarship). Michaels authored chapter 49 of *The State of Humanity*, titled "The Greenhouse Effect and Global Change: Review and Reappraisal." See also Ehrlich and Ehrlich, *Betrayal of Science and Reason*.

[12] See *The American Almanac, 1996-1997 edition*, tables 655 and 656. From the tables, it appears that productivity per hour in the American workforce averaged at least a 20% increase between 1973 and 1992, while wages per hour fell about 10%.

[13] See Holly Sklar's "Let Them Eat Cake" *Z Magazine*, November 1998, pp. 29-32. From 1992 to 1997, a period of economic boom times, particularly for Wall Street, the American wage temporarily halted its decline, "soaring" from \$12.09 to 12.26, for an annual increase of 0.28% per year. Is that "good news?"

[14] As a category, only the top five percent of American families had an increase in wealth between 1983 and 1995. See Holly Sklar's "Let Them Eat Cake" *Z Magazine*, November 1998, pp. 29-32. The top 1% has the same amount wealth as the bottom 95%, and the world's richest man, Bill Gates, has more wealth than the 100 million poorest Americans do. A 100 million-to-one ratio is beyond the realm of the surreal, a situation passing in silence among the "good news" crowd.

A Brief Economic History

Economic history is an important field of study. In anthropology, whether studying today's hunter-gatherers or performing archeological digs, analyzing evidence that is tens of thousands of years old, the issue of economics can scarcely be separated from the political aspects, and often the spiritual aspects, of the studied societies. In pastoral societies of Asia's steppe regions, wealth was often measured by how many horses somebody had, and he with the most horses was the chief. In the so-called [primitive economies](#), food was the greatest wealth, which was directly related to the land. Food was obtained by labor, so when civilizations arose, land, labor, and food were inextricably linked to the political dynamics, and usually the spiritual/religious dynamics. One theory of political science is that when population densities increase, increasingly stratified political/social structures evolve. As political empires grew, so would their wealth-concentrating capacities. The so-called evolution of hunter-gatherers to domestic farmers and herders and to "civilization" has been called the evolution from egalitarianism to kleptocracy. In the more "primitive" civilizations, everybody was more or less treated equally, while in the more "advanced" societies, the leaders and elite classes were largely power-hungry thieves.[\[1\]](#)

Although such a dynamic is practically considered a "law" of political science, today's political science

evolved in the West, with all the bias that entails. Although that “law” appears to be generally true for places such as the [New World before Columbus stumbled into it](#), there also appear to be significant exceptions, going both ways: of stratified societies that were largely hunter-gatherer, and huge, heavily populated regions that were not steeply stratified.[2] In the “soft” sciences such as anthropology and political science, just as in the hard sciences, the danger is to believe that one’s theories have universal and timeless application, and are “laws.” As Einstein said, *every theory is eventually killed by a fact*.

The earliest industries, such as the forging of copper and iron, grew from artistic endeavors, and the metal that became the subject of more human passion than any other, gold, may have been the first metal that was worked, although it is more generally thought that [copper was worked first](#).[3] The so-called cradle of civilization, the [Fertile Crescent](#) (mainly modern-day Iraq), is apparently where societies first changed from egalitarian to kleptocratic, and where relatively peaceful agricultural societies, with [goddess-based, earth-based religions](#), were overthrown by pastoral tribes who had violent, male sky-god religions, and the “dominator” society that dominates today’s world was born.[4] Gold was associated with the sun, and was considered a sacred substance in many cultures, and was used in artwork. Gold was too soft to make tools or weapons, but it became the artistic and sacred metal.

According to modern archeology’s findings of (always subject to radical revision as more evidence comes to hand, and contrary evidence fights its way past orthodox suppression, and [paradigms shift](#)), slightly behind the rise of [Sumeria](#) in the Fertile Crescent was Egypt, another river-valley civilization. Whereas the Fertile Crescent had little gold, Egypt had the first great gold mines, out in the desert. Worked by slaves, their bones littering the mines, Egypt set the pattern of Western gold mining labor standards. The slaves were deemed expendable, and properly feeding and housing them was more costly than obtaining new slaves, so the logic of the day demanded that the slaves be worked to death in the mines, if they even survived the journey to them.[5] Gold was reserved for royalty, as it was central to Egypt’s sun god religion. Gold abounded in the royal quarters, their thrones and tombs. Gold was officially a royal monopoly, although there was a black market for it. The gold made its way in small measure to the commoners, and the other burgeoning civilizations lusted for it. Pharaohs gave gifts of the highly coveted gold to neighboring rulers, and from the beginning, even the Pharaoh’s gold was debased with copper. The gold buried with the Pharaohs was eventually dug up by grave robbers, making its way into the economy as jewelry and a symbol of wealth.

In the Old Testament, even the Jewish god lusted for gold. When Joshua laid siege to Jericho, with his god’s miraculous aid in crumbling the walls with the sound of trumpets, Joshua’s men killed every man, woman and child in Jericho, as well as all their livestock as “an offering to the Lord” (he spared the prostitute who betrayed her people and harbored Joshua’s spies).[6] Then all the gold, silver, bronze and iron was salvaged and put into the “lord’s treasury.”[7] That was one way of securing the Promised Land and filling up the coffers. King Solomon had his mines, and Jerusalem’s temple was gilt with gold.

Egypt eventually declined, largely from internal corruption and encroachments from its neighbors. From Assyria to Babylonia, from Hittites to Minoans to Phoenicians and Carthaginians, from Persia to Greece, empires continually rose and fell in that region. Gold was a central concern of all of them, and was the universal measure of wealth. As an empire rose, it plundered all the gold it could from its

neighbors. The same piece of gold could pass through many incarnations over the millennia, perhaps starting as a work of art after being gleaned from the earth. Then it was buried with its owner, then the grave was robbed and it was sold for food. Then it was melted down into bullion, then made into a coin, then melted down into a new coin of a new empire, then becoming part of a temple's artwork, then stripped during the sack of a city and eventually made into an ornament, then getting buried again, to be discovered by nineteenth-century grave robbers, and it sits in a museum today. Mining took place across that part of the world, usually in or near mountains. From Central Europe to the Caucasus Mountains, from Ireland to Africa and Persia, gold was being mined, usually by slaves.

The enigmatic Etruscans were awash with gold, and their civilization led to the Roman Empire, which eventually became the known world's center. The Roman Empire is often seen as the pinnacle of ancient civilization, but the Roman experience can make one wonder whether "civilization" is desirable. Using much of what the Etruscans taught them, the Roman Empire built great buildings, roads and aqueducts that people still marvel over. The Roman Empire was also one of the most murderous, greedy and cruel regimes the world has known. Political murder, debauchery and greed were standard features of Roman life. If one became part of the middle class or better, life could be pretty good. Yet, the Roman Empire was built on the blood and bones of those who did the work. Hundreds of thousands of Rome's inhabitants received free food. To entertain the masses, people were forced to murder one another at the various arenas, the grandest being the Coliseum, where the Emperor would lead the festivities. Historian Michael Grant wrote that history's "two most quantitatively destructive institutions are Nazism and the Roman gladiators."[\[8\]](#) Those who died in the arenas were usually slaves, which meant people from lands that Rome conquered.

The slaves often preferred taking their chances in the arenas rather than work in the imperial mines. As with other empires, a primary thrust of the Roman Empire's expansion was securing all lands where gold was found, either plundering the royal treasuries of conquered lands, creating new mines, or taking over existing ones. Rome's most productive mines were in Spain, where a great fountain of gold poured forth, and great piles of corpses were created. Rome eventually succumbed to its internal corruption, and Europe reverted to a primarily agrarian culture for the next thousand years.

Civilized people did not comprehend the difference between real wealth and its symbol. Gold was the ultimate currency, because it was scarce and durable. There is no intrinsic wealth in gold. Ancient peoples could not eat it, or make a tool or weapon from it. In the world's first major economic treatise, Adam Smith's *Wealth of Nations*, he noted how misplaced the search for gold was:

"The most abundant mines either of the precious metals or of the precious stones could add little to the wealth of the world. A produce of which the value is principally derived from its scarcity, is necessarily degraded by its abundance."[\[9\]](#)

Smith wrote about gold rushes:

"Of all those expensive and uncertain projects [he was writing about the Spanish gold rushes begun by Columbus - ed.], however, which bring bankruptcy upon the greater part of the people who engage in them, there is none perhaps more perfectly ruinous than the search after new silver and gold mines. It is perhaps the most disadvantageous lottery in the world, or the one in which the gain of those who draw the prizes bears the least proportion to the loss of those who draw the blanks: for though the prizes are few and the blanks many, the common price of the ticket is the whole fortune of a very rich man. Projects of mining, instead of replacing the capital employed in them, together with the ordinary profits of stock commonly absorb both capital and profit. They are the projects, therefore, to which of all others a prudent law-giver, who desired to increase the capital of his nation, would least choose to give any extraordinary encouragement, or to turn towards them a greater share of that capital than what would go to them of its own accord."[\[10\]](#)

Seeking gold mines and engaging in gold rushes has almost always been fueled by greed and desperation. If one had expendable slaves, gold mining made sense. Ancient Egypt had slaves, and ancient Rome greatly advanced the craft, creating technological improvements (and borrowing some from Greece) in order to enhance mining efficiency. It was efficient in that they mined more gold, and efficient from the standpoint of getting more production from the slaves before they died.

What those ancient civilizations failed to comprehend was that true wealth was food, shelter, clothing and an environment that could sustain it. The Mediterranean region used to be forested. The Palestine of the Bible was forested. The Fertile Crescent was forested. Northern Africa was forested. Civilization destroyed the forests, and the land's ability to sustain life. The Mediterranean's desert-like environs are not a natural condition, but the [result of humankind's depredations](#). While Egyptians and Romans sent millions of people to death in the mines and arenas, they also made the world poorer. Carl Sauer [remarked long ago](#) on how our economic theories fail to account for what real wealth is, and how our "progress" has destroyed the world's real wealth. Destroying ecosystems in the name of greed or short-lived agricultural prosperity is suicidal, but a relative few are able to lead lives of extravagance for a short time, while countless others suffer greatly, including non-human species. That is civilization in action. All civilizations have collapsed, if they were not destroyed through conquest, because they were hostile to life. Humanity is on the brink of a global environmental collapse, as the price of our current global civilization. The ancients confused the symbolic with the literal, thinking that a contrived *symbol* of wealth and prosperity was wealth and prosperity itself. Their ignorance, rapaciousness and foolishness doomed their civilizations.

With the Western Roman Empire's collapse, Europe did little gold mining for the next thousand years. As Europe began acting as a cohesive entity and evolved once again beyond a primarily agrarian state, it wanted the fantastic riches that were in the Islamic and Eastern Roman world, and the rich lands beyond, such as in India and China. It took some of the Islamic and Eastern Roman wealth by force during the [Crusades](#). During the late Middle Ages and Renaissance, the specialization of labor became more prevalent as Europe again evolved beyond an agrarian society. Guilds and other institutions came into being. Various professions developed. Alchemists tried creating gold from lead and other tricks. Although they failed at transmutation, their labors led to chemistry and today's science. During the 1200s, European prosperity reached its highest levels since the Roman Empire,

yet there was little mining activity, and the Byzantine and Muslim world had most of the gold. Silver coins were becoming increasingly debased, and gold coins began being minted again in Europe.[\[11\]](#)

Banking began when civilization did. In the Sumerian city of Ur, where religion, economics, and politics were virtually united, the temples became the repository of gold and the first banks. Goldsmiths became the first bankers, a situation evolving naturally from gold serving double duty as the ultimate artistic medium and currency. As Europe emerged from the Dark Ages, from the milieu of pawn brokers and moneychangers came the merchant banker, who charged interest to various parties, often financing commercial ventures. The economic culture of that time has been called protocapitalism, or capitalism's forerunner.

When Columbus tried finding another way to the [Asian spice trade](#), he [stumbled into the New World](#), and unwittingly initiated history's biggest gold rush.

The Biggest Gold Rush of All Time

After a generation of plundering the New World, the Spanish were scouring the Caribbean to replace the fast-dying natives in [Española's mines](#), and the Caribs of the Lesser Antilles fought back, even defeating the genocidal invaders. The Spanish then avoided them in search of easier prey. As the Greater Antilles' and Bahamas' natives became extinct, the Spaniards [struck out along the Caribbean periphery](#). In present day Panama, [Vasco Núñez de Balboa led his men in search of gold](#), and "discovered" the Pacific Ocean, which he claimed for Spain, the single largest "claiming" in history. Eventually the Spanish depredations and their frenzied search for gold took them to Mesoamerica and the Aztec Empire, whose capital, Tenochtitlán, was a glittering city in the middle of the vast lake that dominated the Valley of Mexico. The Spanish had clearly demonstrated their sense of honor at the [Xaraguá massacre](#) and other events, and their strategy against the welcoming Aztec Empire was to kidnap Montezuma. [Hernan Cortés](#), who [stole the expedition](#) from the governor of Cuba, had everything in hand, with Montezuma as hostage and his men cleaning out the royal palaces of its treasures, until the Cuban governor sent an army to end Cortés' usurpation. Cortés bribed the Cuban governor's army with stolen Aztec gold, easily won that confrontation, and the Cuban governor was ruined.

While Cortés was [busy with the Cuban army](#), the man left in charge at Tenochtitlán perpetrated a mass slaughter of thousands of Aztec citizens at a festival. Then the Aztec welcome wore out, and the local citizens laid siege to the imperial palace. The Spaniards tried sneaking out of town at night, after they likely murdered Montezuma and almost all the Aztec nobility, but they were caught making their escape. They beat a hasty retreat across a causeway that linked Tenochtitlán to the lakeshore, doing battle with the residents of Tenochtitlán. Retreating Spaniards tried leaving with as much stolen gold as possible, filling their armor with it, but many had to swim, and hundreds of Spanish soldiers ended up at the bottom of the lake, weighted down with their stolen gold. Spanish chroniclers have called that event "the night of sorrows." After regrouping in the care of his native allies, Cortés and his men mounted a naval siege that completely destroyed the world's most spectacular city, while killing nearly its entire population.

Sacking the Aztec Empire was the seminal event in the Spanish gold rush. Loot began flooding into Europe, mainly gold. It was then that able-bodied Spaniards began coming to the New World in endless boatloads, looking for fame, riches, and women to rape. The native genocide increased, and during Cortés' conquest of the Aztec Empire the Spaniards introduced the mainland's first smallpox epidemic, which killed off many millions of people. While the treasures they plundered were prodigious, including the world's most [ingenious goldsmithing](#), which was quickly melted down into bullion to make coins, it was a minor haul compared to the mining activities the Spanish would soon undertake.

In 1532, a decade after Cortés found success, the marauding Spaniards discovered an empire richer in gold than even the Aztecs: the Incas. The Incan Empire, along the gold-bearing Andes mountain range, was rich in gold, perhaps the richest on earth.

The Egyptian, Roman and Spanish mining practices were not universal. Professionals, not slaves, performed gold mining in India. Mining for the Incan Empire [was not even considered hard work](#).

In the wake of [sacking the Incan Empire](#), every European mercenary *really* got excited. Along the river valleys flowing from the Andes into the Pacific, the conquerors forced the natives into mining gold and silver, especially at the mine at Potosí, in modern-day Bolivia. The life expectancy of a native in the Potosí mine was about four months. Millions of native lives were consumed in the mining activity. In some regions, [native bones lined the roads](#), as they died while being driven to the mines. The vultures would circle each time a new mine was opened.

One of Pizarro's men, [Hernando de Soto](#), became rich as a king from Incan plunder, but was still not satisfied, and in 1539 he led an expedition into what is today the southeastern United States. Although his predatory expedition destroyed entire civilizations, he found no more gold. At the same time, Francisco Vázquez de Coronado was marauding through what today is the southwestern United States, seeking the legendary city of gold that fired the Spanish imagination. After fifty years of genocidal gold lust, his expedition was Spain's first one that tried treating natives well as they searched for gold. Even so, his men wantonly killed the natives, burning them alive to set an example, etc. His was the "well behaved" expedition.

The Spanish crown's main preoccupation was the [flow of loot into its coffers](#), not the natives' welfare. The 1500s saw the greatest demographic catastrophe the world has known, as the Spanish feverishly sought gold. The population of the New World in 1492 may have been [more than 100 million people](#). The prevailing scholarly estimate today is more than 50 million people (my *Encarta* encyclopedia estimates 90 million). By 1600, they had probably been about 90% exterminated. To wipe out 90% of a hemisphere's population in a century is unparalleled in history.

The gold rush's great irony was that it [brought no wealth to Spain](#). Gold and silver are not wealth, but symbols of it, and the Spanish could not figure it out, being mesmerized by wealth's symbols. Spain's men spent their lives pursuing gold, and consequently Spanish industries and professions declined, also partly because Jews and Moors were forcibly ejected from Spain during the Spanish Inquisition days, and the Jews significantly composed the educated and merchant classes and the Moors were

able agriculturalists.[\[12\]](#) Spain overextended itself militarily by fielding armies to fight in Italy, battling against the Ottoman Empire, trying to put down the Dutch rebellion, fighting pirates and otherwise protecting its imperial domains. By the time their Armada was destroyed in fighting with the English in 1588, the Spanish crown was already in financial difficulty, and would go [bankrupt several times by 1650](#) (the crown's first bankruptcy was in 1557, a mere generation after the huge Incan haul began hitting Spain's shores). Spain was [arguably worse off in 1600](#) than it was in 1500. After the defeat of the Spanish Armada, Spain was quickly on its way to becoming imperial has-beens, with its [imperial domains eventually being seized by its rivals](#). The Spanish gold rush of the 1500s not only killed off tens of millions of people, but also destroyed Spain as an imperial power. There are few historical events more ironic than that, and few bloodier.[\[13\]](#) The New World's gold rush did not end by 1600. Gold rushes propelled major aspects of the European/American invasion and "settling" of [what is today the western United States](#).

The point of the preceding narrative is that when wealth became seen as a symbol and not the real thing, people easily became mesmerized and confused by the abstraction, and threw away and destroyed wealth while pursuing its symbol. The rise of modern banking has further abstracted the concept of wealth. Money is now electronic impulses that travel the globe in an instant. With that further abstraction, what real wealth *is* has been almost completely forgotten by our "modern" societies.

About a century ago, as robber barons such as [John Rockefeller](#) and Andrew Carnegie were taking over colleges, [medical schools](#) and other American institutions, reshaping and corrupting them to further their ambitions, the banking robber baron, J.P. Morgan, was reshaping the American banking system. The Federal Reserve System was born in those days. There are plenty of conspiracy theories regarding those events, and [some of them may well be true](#). Today's international banking system can turn billionaires into paupers overnight, and vice versa. I have seen it happen. There are arguments about banking leaving the gold standard. The reasoning is that if money was based on gold, then the governments and banks could not issue money at will, but it had to be backed by something tangible. As history has shown, if money is based on gold, it leads to gold rushes, which in the big picture are merely counterfeiting operations, which in essence is stealing from one's neighbor. The problem is not whether money is backed by gold or not. The problem is [greed](#), and mistaking the symbolic for the literal.

The Need for Public Accounting

As the West's ideological systems have become more abstract, frenzies of greed turned into the 1920s' stock market speculative fever and similar events. The Great Depression followed the stock frenzy, which led to [World War II](#). I worked for a dot.com during the peak of the stock market hysteria in 1999, and it was evident where the hoopla would lead. In the wake of 1930s bank failures and the 1929 stock market collapse, laws were passed to prevent those events from happening again. In the 1930s, the Securities and Exchange Commission came into being. While public accountants existed before the 1930s, the securities acts of the 1930s created the reason for today's public accounting profession

to exist. When I [began my career](#) in 1982, the majority of revenues that public accounting firms earned, especially in the Big Eight (the world's eight largest public accounting firms), were from performing audits that the securities laws demanded. All corporations that sold stock to the public were required to have an annual audit. Public accounting firms performed those audits. Their job was applying generally accepted accounting principles (GAAP) to corporate financial statements, to ensure they counted their profits properly. Since [making a profit is the Holy Grail of capitalism](#), corporations have many temptations to overstate their profits, and audits were designed to keep them honest.

Related to securities laws, banking laws were also passed, and the federal government began insuring bank deposits. With the government insuring bank liabilities, banking became "regulated," and adhered to various laws to ensure its ability to pay its depositors. Certified Public Accountants (CPAs) audited banks, just as they did any other corporation. Because banking was a regulated industry, there were also auditors from federal and state levels. On paper, it sounded good, but there was a major conflict of interest that exists even today. Corporations could hire their CPA auditors, and fire those that displeased them.

In economics parlance and governmental regulation, the concept of "regulator capture" is well known. In essence, the industry being regulated corrupts the organizations that regulate them. That capture works both ways. The industry wants to capture its regulators, and the regulators themselves desire capture, [as corruption pays well](#). In government agencies, there are many laws and rules to prevent regulator capture, but greedy and corrupt regulators and industries ingeniously circumvent the safeguards. Instead of being public servants, regulators become corporate servants, looking out for their patrons' interests, not the public's. It has happened in every regulated industry, to one degree or another, from the [FDA](#) to the [USDA](#), from the [insurance industry](#) to [banking](#). Regarding public accounting and corporate audits, how hard is it to capture the regulator that corporations literally hire? It is the world's easiest capture, yet that relationship has been obscured by plenty of secrecy and propaganda. The largest financial scandal in U.S. history was the Savings and Loan Scandal of the 1980s, and I was there, watching it happen.

The Savings and Loan Industry and What Doomed it

The American Dream is a central part of America's self-image. The single most important aspect of that "dream" is owning one's home. Americans' homes are their castles. A home usually costs a few years' wages for an American homeowner. Few people can get that kind of money from their piggy banks, and nearly all American homeowners needed a loan to buy their homes. A specialized bank was created to make the American Dream happen. They were called Savings and Loan banks (S&Ls). Banks make money by offering interest on money deposited at their institution and loaning it out at a higher rate. There are inherent risks in such an institution, and banking laws were designed to minimize them. A typical S&L would offer 3% interest on money deposited with it, and make mortgage loans to homebuyers at 6%. The 3% spread between the rate paid out and taken in funded the bank personnel's salaries, and paid building rent and owner profits.

Interest paid by homeowners to S&Ls was less than other lending institutions earned, for a few

reasons. The house was collateral for the loan, for instance. The risk of loan default was minimized by the ability to repossess the house. That process is known as mortgage foreclosure, the dread fear of most homeowners. Another reason for the low rate was the government passing laws to make homeownership a favored economic situation, with tax deductions for mortgage interest and property taxes, and eliminating the risk to S&L depositors with deposit insurance. S&Ls could pay lower interest rates to their depositors, and thereby offer lower interest rates to homebuyers. In return for deposit insurance, which insured the bank's liabilities, the government theoretically had great say in how banks operated. For instance, the government set the interest rate ceilings that commercial and savings banks could offer depositors, and what kinds of loans they could make. Savings banks were largely restricted to making home loans. They traditionally also made some loans for commercial property. Before Ronald Reagan took office, S&Ls had to keep at least 80% of their assets in home loans, by law.

During the 1960s and 1970s, a number of trends coincided to largely doom the S&L industry. One inherent risk in banking is called inflationary risk. The S&L industry was particularly susceptible. S&Ls would offer a rate of interest to their customers, and the commitment to leave funds in the bank was usually a short-term proposition. To get higher interest rates, multiple-year instruments could be obtained, but most depositors could take out their money whenever they wanted to. On the lending side however, the S&Ls lent out money for twenty-to-thirty-year terms, at a fixed interest rate. They make money by lending it out at a higher rate than they pay their depositors, who can take their money out at any time. If an economy experiences inflation, general interest rates will also climb. I was taught in college that the "real" interest rate historically has been about 2%, which means that the interest rate a lender would charge would be the inflation rate plus two percent. As a simple example, if 10% inflation happens, banking institutions will begin charging 12% for short-term loans. The depositors will also seek higher interest rates, and institutions will begin offering them.

There are a variety of interest-earning investments. There are instruments known as treasury bills, issued by the United States government. There are corporate bonds, and during the inflation of the OPEC days, the money market fund was invented. Corporate bonds and money market funds did not have deposit insurance to back them, so they were riskier investments than a bank deposit, but because of the inflationary 1970s, treasury bills reached 15% rates in 1981, and the prime interest rate (the rate that commercial banks charged their best customers) exceeded 20%. With treasury bills and money market funds offering 15% and higher rates, how long would somebody keep their money earning 3% in an S&L? Not long. If an S&L's assets were earning 6%, locked in for a 20-year period, and inflation kicked up interest rates, and other instruments offered 15% and higher, the S&L's depositors would likely find greener pastures to invest their money. They would not do it twenty years from then, but immediately. That is exactly the situation that the S&L industry found itself in during the late 1970s. The interest rate that the S&Ls could offer was set by law. Also, any institution that had its assets (home mortgages) invested at a 6% yield, and paid out 15% on its liabilities (deposits), was on the fast track to going out of business. Inflation would kill the S&L industry.

In the 1960s, the United States violated a rule of economics. In Economics 101 classes, students learn about the guns or butter economy. Basically, if a nation is fighting a war, it has to divert resources that are normally used for domestic consumption into feeding the war machine. A nation cannot practically do both, even the world's richest. The first half of the 1960s was a period of unprecedented prosperity and optimism for the United States. With a president who looked like a movie star and lived like one,

while presenting ideals such as the Peace Corps and going to the moon, and giving West Berlin a pep talk, with an economy that was history's most stable and prosperous, American prestige was at an all-time high. Then the United States tried to [recolonize Southeast Asia](#) while its [movie star president was murdered](#). America [killed off millions of people in Southeast Asia](#) while throwing away the lives of tens of thousands of American soldiers. Instead of the guns *or* butter economy, the American government tried to manage the guns *and* butter economy. That was the beginning of the end of American prosperity. Inflation began creeping up, from 1% in the early 1960s to 5% by 1970. The guns *and* butter economy led to inflation. Not only was bludgeoning Southeast Asia the world's greatest act of evil perpetrated during the last half of the 20th century, it harmed the United States economy, as well as jump-starting the Japanese economy, which became an economic rival in the 1980s. The peak year for real wages in America was 1973. Wages declined to about ten percent less, and the average American works nearly an hour more per day since then. America's standard of living declined since the Vietnam War days.

The relationship between Europe and the Middle East goes back thousands of years. Most of Western Europe and the much of the Middle East were part of the Roman Empire 2000 years ago. When the Roman Empire [adopted Christianity as the state religion in 325 AD](#), it set in motion dynamics that contributed to the rise of Islam during the 600s. The Iberian Peninsula and other lands came under Islamic rule, and the [Crusades and Iberian Reconquest](#) that began in the 1000s initiated conflicts between the Islamic and Christian world that last to this day, and [Jews have often borne the brunt of it](#). Turks eventually displaced Arabs as Islam's most powerful group, and the Ottoman Empire lasted for centuries. The Islamic culture began stagnating as the Middle Ages waned, and Europe's conquest of the world impacted Islamic culture. It became insular, in contrast to its former expansionism. By 1800, [the Ottoman Empire was a shadow of its former grandeur](#), and was largely kept alive by the Great Powers such as Britain, France, Austria, Russia and Prussia, as they jockeyed with one another for influence. Russia and Britain played the Great Game, and conflicts such as the Crimean War characterized the Great Powers' gamesmanship, as they kept nibbling at the Ottoman Empire. For all the historic animosity between the Christian and Islamic world, the Middle East was about the planet's last place that Europe conquered. By 1900, the Ottoman Empire's elites (e.g. Young Turks) were heavily influenced by European culture and ideals, but Europe regarded it as a backward area that was mainly a source of cheap labor and a market for European manufactures. The *Eastern Question* was Europe's debate regarding what was to be done with the decaying Ottoman Empire, and the Great Powers clashed with each other over the issue. Then the industrializing West found [oil to be an essential resource](#), and the jockeying became intense in the 20th century.

No empire lasts forever, and neither do any power plays. Although [oil politics played a major role](#) in drawing the national boundaries of today's Middle East, the region's people gradually gained some measure of control over the oil wealth that the Great Powers were plundering. As nationalistic fervor was ascendant in the new nations, governments were overthrown, as when the United States [overthrew Iran's government in 1953](#), in order to keep control over the oil. The United States helped overthrow the Indonesian government in 1965, putting a [genocidist](#) in charge of another oil-rich nation.

Oil exporting nations, largely from the Middle East, formed the Organization of Petroleum Exporting Countries (OPEC), and reacted to the Arab-Israeli war in 1973 by halting oil shipments to nations that supported Israel, [the United States in particular](#). Oil prices jumped, and thus began the cycle of

inflation that swept the world economy beginning in 1973, and severely damaged numerous national economies. In 1979, Iran finally overthrew the U.S.-installed Shah, and the next year saw Iraq and Iran begin a disastrous war that lasted several years, which further spiked oil prices.

When studying the Middle East's ferment, for instance, the false dichotomy is a commonly encountered [logical fallacy](#). While one cannot cheer for the power struggles that Iran, Iraq and Turkey have engaged in, especially how the [Kurds](#) have fared at their hands (or the Armenian genocide), that does not confer any integrity to the West's motivation for its Middle Eastern involvement. The primary motivation for all imperial societies has been controlling the resources of its subject lands. Whether the empire was Roman, British or American, controlling and plundering the resources of the subject lands have always been the primary motivations. Today, the United States perpetrates genocide in [Iraq](#) as part of an effort to control the region's oil. The current [War on Terror](#) is also oil-motivated. Securing access to cheap and plentiful oil has been about the *only* motivation for the West's involvement in the Middle East for the past century. Ironically, [we likely do not even need oil](#). That need is an artificial one, foisted on the world by the oil industry, as it has [eliminated any and all alternatives](#) to oil and other monopolizable energy sources, as I discovered first-hand.

During the 1970s, Iraq became the radical Arab nation, nationalizing its oil industry and charting a course of development largely independent of United States involvement, using its oil revenues to benefit the population at large, attaining the highest standard of living of Middle East nations. The dynamics that benefited Iraq, however, wrecked other national economies. The inflation that the oil price increases initiated throughout the world doomed the S&L industry. With its assets invested in 6%, 20-year mortgages, and inflation causing 15% treasury bills to be offered, the S&L industry was doomed.

The Savings and Loan Gold Rush and Public Accounting

While global economic dynamics doomed the S&L industry, the scandal that happened was not much different from a pack of wolves descending on a weak member of a caribou herd, and the American taxpayer was ultimately feasted upon. Investigative journalists are an endangered species in the United States. That is partly because any journalist who performs investigation that exposes the misdeeds of the powerful is often [silenced in one way or another](#). Sometimes independent investigators are [murdered, and it is made to look like a suicide](#). Journalists can be fired and blackballed from the profession. Other times, publishing companies will refuse to publish their books, or even [destroy their publishing company to prevent a book's publication](#). However, with the deck stacked against investigative journalism exposing what happened during the S&L scandal, two books stand above them all: Pizzo, Fricker and Muolo's *Inside Job* and Pete Brewton's *The Mafia, CIA and George Bush*.

The story presented by those investigative reporters is not unusual. It is a story of greed, corruption, crime, murder...typical American politics and economics. In 1980, Congress began eliminating the interest rate ceilings on S&Ls and commercial banks, and simultaneously raised deposit insurance

from \$40,000 to \$100,000 per account for S&Ls. That got the attention of Mario Renda and other organized crime figures. Senator Jake Garn of Utah, who received huge contributions from the S&L industry, co-authored the Garn-St. Germain Act, which Ronald Reagan signed in October 1982. It set the stage for the S&L scandal. Fernand St. Germain's financial irregularities connected to the scandal helped end his political career. Key elements of that bill were allowing the S&Ls to offer money market funds and allow up to 40% of their assets to be invested in non-residential lending. Renda and other Mafia figures eagerly watched the Garn-St. Germain Act make its way through the legislature, rubbing their hands together. Deregulation was the buzzword of the Reagan administration, and "getting government off the public's back." Ironically, the American public has never paid more dearly than it did during Reagan's deregulation. Other regulation loosening occurred, with California letting S&Ls invest in whatever they wanted to. The S&L scandal was the worst in Texas, California, Colorado and Florida, and it is no accident that [George Bush the Second](#) and Jeb Bush have been governors of Texas and Florida, while Neil operated in Colorado and [Reagan](#) was the California governor.

[George Bush the First](#) used to run the CIA, and when Pete Brewton began investigating the unfolding scandal in the 1980s, the list of people he ran into was a Who's Who of the 1980s scandals. Oliver North, Charles Keating, John Hull, Michael Milken, Larry Mizel, George Bush and others kept popping up, as well as bona fide gangsters such as Carlos Marcello and Santos Trafficante. Brewton's investigation had eerie parallels to [Danny Casolaro's investigations](#). There were even [JFK assassination](#) connections to Brewton's investigation. In essence, what happened in the S&L scandal was that a gang of criminals, including the CIA, the Mafia, Washington politicians and others all participated in raping the nation's S&L industry, eagerly sidling up to the trough while it lasted. Our politicians took away the controls over the S&L industry, while *increasing* the bag the taxpayer would hold if it all came crashing down. As the authors of *Inside Job* randomly selected S&Ls to investigate, the same people would keep appearing, working at one S&L, looting it until it went under, then going to work for another and repeating the same process.

The same people that figured so highly in the Iran-Contra Scandal, where drugs were brought into the United States and arms shipped to our mercenaries in Central America, were also [laundering drug money](#) through the S&Ls that were being looted, in George Bush's back yard, by his buddies. Although the official investigation concluded that probably no more than 15% of the losses incurred in the scandal were due to outright fraud, official investigations [always downplay or ignore fraud and corruption](#).^[14] While there is no doubt that numerous factors played their role in the scandal, fraud and corruption may have accounted for more than half of the losses. A 1988 U.S. Comptroller of the Currency report stated that less than ten percent of savings and loan failures were strictly due to economics, and the Government Accounting Office issued a report in 1989 that identified insider abuse and fraud at 64% of the banks that failed in 1987.^[15]

It was definitely a bi-partisan scandal, with both George Bush and Lloyd Bentsen keeping the scandal quiet until after the 1988 election, as they both were deeply involved in the scandal, as was their crony Walter Mischer and others. Neil Bush helped loot Silverado Savings^[16], which cost the taxpayers more than \$1 billion, and the same people who orchestrated much of the S&L scandal [run the White House today](#). The criminal behavior engaged in by George Bush and friends was staggering, and they mainly got off scot-free, using front men and plausible deniability (much of the denial was not that plausible) to dodge the worst of the charges. Corrupt and greedy politicians and regulators also played

their part. The focus of this essay, however, is presenting the role that my profession played in it, and how the next scandal that comes along will likely be handled the same way, because the same conflict of interest and invitation to corruption still exists. There was no basic reform in the wake of that disaster. This essay will cover the basics of how the money was stolen from the S&Ls and how my profession abetted it.

Residential real estate, which was the primary reason the S&L industry existed, can be a risky business, but is far less risky than commercial real estate. In building tract homes, sometimes there are buyers before the ground is even broken. The first house my family owned was purchased that way, and I saw it being built in 1964. Even if a buyer is not found before building commences, home building is usually a response to demand, and developers have to shoulder some of the risk. A bank will not provide a construction loan unless the developer is putting up some money, similar to a bank not giving a mortgage loan to a homeowner without a down payment. If the homeowner has not made an investment in the deal, his/her incentive to take care of the house is questionable. Requiring a down payment is simply a sound business practice.

Commercial real estate, on the other hand, has more inherent risk, partly because the investment is larger. Building a \$100 million office complex or mall is a much different proposition than building ten homes for a million dollars. If a bank is going to put up \$80 million to build a mall, they are usually careful about investigating the lending opportunity. In practice, ground will never be broken on a mall unless “anchor tenants” (Sears and other large stores) are already signed up to lease the facility. The same goes for office buildings. The income from commercial property is rent. If there are no tenants, there will be no rent, and the loan will not be repaid, leaving the bank holding the bag. When building a mall or office building, the bank does not just cut a check; the money is loaned gradually, based on the progress of construction. If the project is half complete, then the bank will have lent about half of its loan to the developer.

Many transactions during the S&L scandal were plainly fraudulent. One strategy was taking a piece of swampland in Florida or desert in Texas, and two parties would sell the property back and forth to each other, raising the price each time. They might take a piece of wasteland worth nearly nothing, and the bank would lend out millions of dollars to finance the sham purchases, with the two parties slinking away with millions of dollars and the bank owning the worthless property. It also happened with buildings. For instance, some people used a California S&L to sell a condominium project back and forth, acquiring it for less than \$4 million and eventually inflating its price through the sham transactions to \$40 million. The mortgage broker who put the deals together was soon murdered in gruesome fashion.[\[17\]](#) That was one of the more extreme instances of how the gangsters operated, but those dynamics also played out in the “legitimate” deals that happened.

A bank had to justify loaning \$40 million on property that was purchased for less than \$4 million a few months earlier, and the document all banks used was an appraisal. There is an appraiser profession, and their job is valuing properties. If a bank ponders making a loan, it hires an appraiser to assess the property’s market value, which may or may not justify the loan. The highest credential that an appraiser has is known as the MAI, which means Member of the Appraisal Institute, in Chicago. If the bank’s board of directors were the ones doing the looting, however, they readily hired a pliant appraiser to cook up whatever appraisal value they wanted. Behind every fraudulent loan was a fraudulent appraisal. It is nearly impossible for appraisers to render independent appraisals if the people hiring

them do not want one. When I was in public accounting, auditors joked that MAI stood for “Made As Instructed.” The appraisals were largely worthless because they were not independently rendered. It is so obvious that it should be beneath mention, but that situation still exists. There were obviously situations where an accurate appraisal was desired, and one was rendered. All too often, however, the appraisal was used as a tool to make a fraudulent or questionable loan.

Here is what I saw when [I was on one of the biggest audits of the whole S&L scandal](#). It was 1984, four years before the government told the American people that we had a big problem, and by 1988 the damage had already largely been done. The scandal could have been prevented or minimized in 1984 if my profession had been honest. In 1986, the S&L problem could have been handled for only about \$20 billion. Along with raising the deposit insurance and removing the limits on what could be invested in, S&Ls began dealing in brokered deposits, where it was not a real depositor putting money in the bank, but a middleman seeking the highest interest rates. Because S&Ls had deposit insurance, it was as risk-free an investment as one could make, especially attractive when S&Ls began offering money market funds. The negative interest rate spread described earlier would destroy the S&L industry.

Here is the “plan” cooked up to save the S&L industry. The S&Ls would take in billions of dollars of brokered and direct deposits, and instead of lending them on residential real estate they would use the money to fund high-risk ventures, usually commercial real estate deals. They would charge 22% interest on the high-risk deals, and regain the positive interest rate (22% coming in to 15% going out) spread that inflation drove into a negative position (6% coming in to 15% going out). On paper, it might have had a prayer, but “high-risk” means that there is a high risk of failure. A competent real estate developer could borrow at less than 22% interest (or even 25%, which I saw). With all the brokered money coming in, where the S&L paid 15% interest for the money, they had to loan out the money, and fast, to earn enough to pay the depositors. S&L loan officers began beating the bushes across the nation, looking for developers to loan the money to at 22% interest. Loan officers went on the road, leaving their home states, looking for places to loan the money. Consequently, they became the lenders of last resort. A developer in Colorado, for instance, with delusions of grandeur, envisioning a glittering office building, could not get a local bank to fund his pipedream, but a loan officer from California would happen by, flush with brokered deposits, and that developer found a fool to bankroll him.

The bank was so eager to loan the money that the loan officer reduced or waived the developer’s “down payment,” reducing the developer’s out-of-pocket risk and incentive to wisely spend the loan money. Also, other standard practices, such as finding tenants before ground was broken, were also minimized or abandoned, and the “build it, and they will come” mentality prevailed. “See through” (tenantless) buildings were built across America’s West during the S&L scandal. As I look back, it is hard to believe that people could be so stupid. Some of that seeming stupidity was actually diabolical sanity, as the players knew exactly what they were doing, and making off with billions of dollars, looted from the S&Ls, was the game that many played, with prominent politicians and “pillars of the community” gorging at the trough. Also, part of the seeming stupidity was again the abstract nature of the situation. It was another gold rush where a few got rich and the rest of society paid heavily, the vast majority being blind to what was happening.

Here is a typical situation at the S&L I helped audit. We did not see much outright fraud, although I recall seeing a million dollar loan where the developer pocketed the construction loan and fled to South

America. The standard situation with “troubled properties” began with a developer wanting to build a strip mall, office building, motel, etc. He wanted a \$3 million loan to build a strip mall, let us say. He thought he could sell it to an investor for \$4 million after it was built, who would buy it as an income property. The developer only had to put up \$50,000 of his own money as the “down payment.” He probably paid himself \$200,000 in salary while building the building, more than recovering his initial investment. He built a strip mall as a speculative deal. He did not have any tenants signed up before he began building it, and the local market was unlikely to provide enough tenants to rent it out. He also did not have an investor lined up to buy it when it was finished either, but the bank figured it would deal with the situation later. In order to justify the \$3 million loan, a pliant appraiser was hired to concoct the appraisal. Realistically, there was great risk in the deal, with no tenants lined up, no investors lined up, and a weak tenant market. The loan officer from out-of-state had little idea of the local market conditions, and let the principles of prudent real estate development slide, as he received a big commission when placing the loan. The loan officer got a big payday, the developer got a big loan, the appraiser was paid well, and everybody was happy.

Then the developer built the strip mall. Because it was out of state, the bank rather imprudently funded the construction loan; instead of the careful inspection of the progress of construction, the developer got paid in advance of really needing the money, used substandard materials and workmanship (so he could pocket even *more* of the loan proceeds), and when the strip mall was finished, it was poorly built and there were no potential tenants waiting to occupy it. The developer had risked only \$50,000 of his own money, and more than recouped it from what he paid himself from the loan. The situation became a “walk away.” As with a mortgage on a home, the developer had ownership of the project and the bank held a lien. When the developer walked away from the property, reneging on his loan obligation, telling the bank to come after him for the \$3 million if it dared, the bank had little option but to foreclose on the strip mall. When the bank foreclosed, it became the owner of the property and not just the lender. In banking parlance, that piece of property became “real estate owned” (REO).

Realistically, that empty building would only sell for two million dollars on the market. According to generally accepted accounting principles (GAAP), if the bank sold the building for \$2 million, it would have to realize a \$1 million loss, the difference between what it invested in the project and sold it for. In practice, the loss was even bigger because of additional costs involved in foreclosure, etc. Here is a chart to show what should have happened if they had sold the property.

Original construction loan	\$3,000,000
Sales proceeds from foreclosed property	\$2,000,000
Loss to be recognized	\$1,000,000

Even if the bank could not find a bona fide buyer, it was supposed to write down the property to fair

market value on the books, taking the loss on its financial statements. The S&L industry, however, was in dire straits. Reporting a loss on the deal would not look good, and might get bank regulators, auditors and others asking questions. Here is what the bank did to hide its loss. Another developer showed up, with similar delusions of grandeur and an equally pitiful pipedream, except his was twice as large. He wanted a \$6 million construction loan. The bank hired an appraiser to concoct the appraisal for the original empty strip mall that valued it at \$5 million, even *higher* than the original pie-in-the-sky price tag that the original developer dreamed up. The MAI appraiser would appraise it for whatever number the bank wanted. The bank would tell the second developer that it would loan him the \$6 million if he would buy the empty strip mall for \$5 million. The bank would loan the developer the money to make the down payment on the empty strip mall, and the first two years of loan payments. The developer never got his hands on *that* money, but the bank held it in escrow, taking the money out of the account to make the down payment and loan payments.

When the bank made the \$6 million construction loan to the second developer, and played internal accounting games to concoct the “sale” of the first strip mall, instead of recording the \$1 million loss, it recorded a \$2 million *gain*, had a new performing loan on the first strip mall, and the loan was guaranteed to have loan payments made on it for two years. Here is a chart to show how the bank hid the loss.

Original loan	\$3,000,000
Second MAI “appraisal” and sale price to second developer	\$5,000,000
Gain on phony sale to second developer	\$2,000,000

So, with some fancy games and pliant appraisers, the bank recorded a \$2 million gain on its deal making. The reality, however, was that \$9 million had gone out the door, the bank was paying 15% interest to depositors, and no money was coming in, not even interest payments. An honest auditor would have made them record a \$1 million loss when they repossessed the empty strip mall, instead of the phony \$2 million gain they recorded on the “resale.” Of course, the second, even bigger, strip mall became another shoddy walk away. The second developer did not have to put down any money, and there were even instances of developers walking away from the loan officer with money *being given to the developer*, to enter surreal realms of finance. When the second strip mall became another empty building, the bank would keep up the phony appraisals and accounting tricks to keep the new losses hidden. With that game going on, the bank would eventually run out of money.

Precisely that disaster happened to the bank I was auditing, and the worst situation I saw was where the bank had loaned \$10 million to build a hotel that was worth \$3 million. It was recording record profits when it ran out of money and the roof caved in. The public accounting profession always stresses that its accounting procedures are not designed to detect fraud. That is partly

understandable, but when the management is committing the fraud, and they are writing the auditors' paychecks, how many auditors will blow the whistle? In the situation presented here, there was nothing that would overtly be called fraud. The S&L I audited had a large REO department. The troubled properties were not hidden, with the transactions plainly seen. No auditor relied on the appraisals, as they knew they were often not worth the paper they were printed on. During that audit, I was sent from facility to facility, trying to locate the appraisals for troubled properties. Many times, the bank *could not even locate* the appraisals. It was obvious to any auditor that a series of phony transactions had been set up to hide the losses. The predecessor auditors of that S&L were fully aware of that situation. Similar to the appraisers, they were not independent, as the bank hired them, and could hire somebody else if the auditors refused to see things the bank's way.

In the case of Neil Bush's Silverado Savings (Bush was more of a rich boy figurehead than a mastermind, but he was far from innocent), their auditors, Ernst and Whinney, became increasingly reluctant to allow Silverado to keep hiding its losses from its failed construction projects, and Silverado's management endlessly harassed them. Ernst and Whinney stood up to Silverado in a way that few auditors ever did during the S&L scandal, and Silverado merely fired them and hired another, more pliant, auditing firm.^[18] As my [partner said that memorable day](#), if we were in our predecessor auditor's shoes, we might have signed off on the same phony financial statements. For a million dollar audit fee, independence quickly evaporates.

During those years, when the entire industry was hiding its losses, with transactions very similar to the situation presented here, billions of dollars were flying out the door to landowners and developers, paying hugely inflated prices for properties. They were the winners in the S&L scandal, and much of the money was obtained by fraud, but there was a paper trail, and phony appraisals and other stratagems could be seen. Also, depositors receiving 15% interest with government-insured money market funds were the other winners. In 1988, a week after George Bush was elected, they finally told the American public the bad news. Even the S&L "cleanup" was more fraud, as S&Ls were being bought up for almost nothing, where some of the buyers, as with those developers, ended up with money in their pocket as result of buying an S&L.^[19] The most extreme instance I heard of was a man putting up nearly none of his own money (around \$1000) to buy "failed" S&Ls, and received more than \$1 billion in federal subsidies in return. In 1990-91, [I worked at an S&L](#), helping to clean up its accounting department, and I worked on the accounting for deals to buy those S&Ls from the government. The S&L "clean-up" was another huge gold rush for the right people. The American taxpayer will pay more than one trillion dollars over a thirty-year period to pay for the disaster, which is probably around \$400 billion in current dollars, if not more.

In the scandal's wake, the big public accounting firms were hurt, but their pain was a fleabite compared to what their negligence cost the American taxpayer. Corporations can still hire and fire auditors. One cannot use competitive principles to enforce regulation. It does not work, and the same situation exists today. No auditor is capable of rendering an independent opinion if their client pays their fee and can readily hire another auditor. Today's audits only keep honest corporations honest, and are virtually worthless in protecting the public's interest. Also, I did not hear of thousands of appraisers being drummed out the profession in the scandal's wake. All we had were "window dressing" reforms. With standard hypocrisy, the thieves chanted the "free market" dogma as they raided the public coffers, and when it came time to face the music, the taxpayer has to pay for all the wonders of the "free market." There are no free markets; it is a capitalistic myth, and a useful one when it comes to stealing

hundreds of billions of dollars from the taxpayer.

In regulated industries, regulator capture and the “revolving door” are two main conflicts of interest that regulators face. The revolving door is when a regulator leaves his government job and goes to work for the very companies he regulated (after a job well done?). The revolving door goes both ways, going from industry to government also, which is less open to corruption. The “revolving door” leads to corruption. In public accounting, the auditors never even go through the door once. They are *never* on the government’s side of the door. Being hired by our clients was common and expected. There was no stigma or even ethical dilemma about it, to demonstrate how far from being a true regulator we were. I never even saw anybody *question* that situation.

As long as professionals such as appraisers and auditors cannot operate in truly independent fashion, more disasters similar to the S&L scandal loom on the horizon. The situation has purposeful design by the corporate order. Their regulators are relatively powerless, with little obstruction to corporations doing whatever they wish, including reporting illusory or distorted profits when they need to. I have been a corporate controller for about ten years of my career, and I know the game. Will we continue to accept this situation, waiting for the next financial disaster to befall the public?

An Enron Postscript and the Next Possible Scandal

The original draft of this essay was written and published during the spring of 2001, and I had no idea that the [next financial disaster](#) was looming so closely. The dot.com collapse of 2000-2001 was not an accounting scandal, per se. While I saw controversy in revenue accounting during my dot.com days (not unusual for a new industry, and there were legitimate issues), the industry’s collapse had little to do with accountants fudging the numbers, but simple “blue sky” market hysteria; the biggest one since 1929.

During early 1999, there were cases where the more money a dot.com lost, the higher its stock price went, due to an economic theory that decreasing losses meant that niche of the Internet industry was “maturing,” so its ultimate profit potential was smaller than one losing more money. When my CFO and I heard that bit of analyst mumbo-jumbo, and the market value of Priceline.com’s stock was nearly equal to the combined market value of all the major U.S. airlines put together, we knew the dot.com frenzy had reached surreal levels. With every crazed boom comes a bust, so the dot.com collapse was no surprise, and the ludicrous nature of many Internet business plans were rightfully laughed at, but far too late for the investors who took their baths. While there was little real accounting fraud, there was analyst fraud, where analysts turned into promoters and lost their objectivity, and there were many instances where the analyst had a financial stake in the stock he/she gave a glowing thumbs-up to.

The Enron and related scandals (WorldCom, Adelphia, etc.) were definitely accounting scandals, and for the same reason the [S&L Scandal](#) happened. The Enron Scandal is particularly ironic for me. The Enron Scandal is an accounting scandal, an [energy](#) scandal, a “[free market](#)” scandal and a Bush scandal. It is not only a sequel to the S&L Scandal, but I was in the [California governor’s lobby](#) a month before 9/11 with Brian O’Leary and other alternative energy pioneers as we tried to get the governor’s attention regarding the possibilities of alternative and free energy. Also, both scandals have some of the same players, the Bush family most prominently. [Criminals](#) and [graverobbers](#) are running the U.S. government and plundering the public, and not many Americans seem to know or care enough to do something about it. Enron was the ringleader in bilking the California energy customer for many billions of dollars (California paid \$27 billion for electricity in 2000, nearly four times what it paid in 1999) during 2000-2001, using “deregulation” as the smokescreen to engage in scams and frauds that would make a gangster blush. With [my experiences in California](#), I had mixed feelings about what happened there; part of me thought it could not have happened to a more deserving state.

I am writing this in May 2006, a few days after the Chairman and CEO of Enron, Kenneth Lay and Jeffrey Skilling, were convicted of fraud in relation to the Enron meltdown. George W. Bush called Lay “Kenny Boy,” as Lay is the greatest individual contributor to Bush’s election campaign coffers, and Bush flew to campaign appearances on the Enron airplane in 2000. An amazing aspect of the Enron prosecutions is that the big crime has been ignored. Being the ringleader in stealing tens of billions of dollars from California electric customers was the big crime, but has been largely ignored by America’s regulatory apparatus. In the documentary *The Smartest Guys in the Room*, you can hear tapes of Enron traders literally shutting down electric generation plants to cause fake shortages so they could make a killing when electric prices spiked to surreal levels. It was organized crime on a virtually unprecedented scale, and it has been ignored. Getting Lay and Skilling for numbers fudging is like getting Al Capone for income tax evasion, except, to take the Enron/Capone analogy further, that the media would have focused on Capone’s income tax trial and underplayed his gangster activities. Such blindness may be so the next time the government evangelizes about deregulation and the magic of free markets, people may not remember that recent example of the unbridled “free market” at work. I have seen firsthand the damage control that is happening.[\[20\]](#) The Enron Scandal’s only saving grace is that the taxpayer is not footing the bill as they did during the S&L Scandal.

This latest scandal wiped out one of the world’s largest accounting firms. It could have been any of them, [as my partner observed](#) during the early days the S&L Scandal. However, the elephant is still standing in the living room, with everybody pretending it is not there. As with the S&L Scandal, there will be no elementary reform or an admission of the obvious: auditors can *never* render independent opinions if their client pays their fee, and can fire them if they do not like the rendered opinion. The only commentator I have yet seen publicly admit the obvious is once again from the radical left, [Edward Herman](#) this time. How willful is this blindness gripping the American government and corporate scene?

Just as the convictions of the Enron executives were being handed down, the next accounting scandal may be looming. The exact same macroeconomic dynamics that [doomed the S&L industry](#) are being repeated today. Oil has shot to over \$70 per barrel with no end in sight, and America has been gripped by real estate hysteria the past few years. America’s financial institutions have been inventing the high-risk loans that have fueled the latest real estate craze, particularly in California. No down payment, no

principal payments for several years, variable interest rates, forty-year and even fifty-year mortgage terms and other innovations have put many millions of American homeowners in vulnerable situations. Once again, the prudent principles of the real estate/banking business are being abandoned. As energy prices skyrocket, inflation and interest rates will not be far behind. It is already beginning to turn around in the spring of 2006, with housing inventories growing rapidly.

The view from my office window in Bellevue, Washington is surreal. If I seem to be overusing the term “surreal” in this essay, it is for good reason, as the word is being used to depict situations that should leave the observers’ jaws hanging on their chests, but each time the masses blithely sail along until it all comes crashing down. There are about a dozen large commercial construction projects roaring along, where several months ago there was only one. There is still a hole in the ground down the street from my office, leftover from the dot-com crash, and yet ten more holes are furiously being dug. When this latest bubble pops, millions of American homeowners will be sitting in negative equity positions (where they owe more to the bank than the home is worth). America’s financial institutions had laws passed that make declaring bankruptcy more difficult, and this coming crash will test those new laws. In the wake of the Enron/WorldCom scandals, the Sarbanes-Oxley Act was passed in 2002 to prevent those scandals from recurring. I enforce those laws as part of my present job. The test of that law may be just around the corner.

When millions of homes go into negative equity positions and banks begin repossessing the “walk away” homes, they had better begin drowning in red ink as they write down their REO to market values. If those banks’ financial statements do not immediately reflect huge write-downs as they repossess those homes, then the next accounting scandal will be on its way. A new factor has been added since the S&L meltdown: the S&L industry no longer exists. Today, mortgage loans are held by a wide array of financial institutions. No specialized institutions such as S&Ls are heavily invested in mortgage loans, so the pain will be spread across a wide spectrum of mortgage holders. On one hand, that may mean that no gang of institutions will bully the accounting profession into avoiding the write-down to market. On the other hand, the problem may be so dispersed that the write-downs will not happen in consistent fashion, and deep in the bowels of huge financial institutions will be many small REO properties (single-family residences) that are worth less than the loan. Also, because the chain between borrower and mortgage holder is so long and complex, those holding the bag may not even realize how bad it is until far too late.

With that conflict of interest continuing to exist in the auditing profession, and as long as profits are the Holy Grail of capitalism, my optimism is very guarded. Do we ever learn? We shall see.

[20] When Pete Brewton wrote his book, the [publishing industry suppressed it](#), for another example of how "free market" censorship happens. Brewton had to find another publisher after Simon and Schuster screwed him, but Brewton was shrewd enough to have a "drop dead" clause in his contract, so he got to keep his advance from Simon and Schuster after they refused to publish his book. A friend of mine co-wrote a book by an Enron executive, which was commissioned by a major publishing company. After they delivered the finished manuscript, the publisher refused to publish it, and even tried getting back the advance for writing it. I got my friend in touch with Brewton, and he advised them. A legal battle ensued, my friend and the Enron executive received a settlement from the publishing company, and they eventually published their book through other channels. With both major publishing companies, it is not necessarily "conspiratorial" on the part of the publishing company, but they may have feared lawsuits from the people the books expose, and when the crooks being exposed run the White House (my friend's book only mentions Bush tangentially, but the Enron Scandal deeply implicates Bush and friends), such timidity is understandable. Whatever the means, the effect is censorship (in the land of the "free press"), and is often more effective than what the Stalinist Soviet Union was capable of.

Trucking, and One Way to Immediately Improve the Lives of Millions

By Wade Frazier

[Introduction](#)

[A Simple Vision](#)

[How It Could Appear in Practice](#)

[The Benefits](#)

[Costs, Considerations, Obstacles, and Possibilities](#)

[Footnotes](#)

Introduction

In the United States today, there are more than three million tractor-trailer truck drivers (the big 18 wheelers), and more than 2.3 million large trucks on the road. Seventy percent of U.S commodities use trucks as their sole source of transportation. Trucks haul more than five billion tons of freight each year, deliver about 80% of U. S. freight, and the industry generates about \$500 billion per year in revenues. More than one million long haul drivers own their own trucks, and about ten percent of truck drivers are women. About \$300 billion in industry revenues come from long haul trucking, about twice the amount of “local” trucking. More than one million Americans, mainly men, live in their trucks. They sleep at “home” only a few days per month. Their real homes are their beds in the back of those cabs. They are modern-day nomads, and theirs is a miserable existence. The number of drivers is predicted to grow rapidly, as truck driving is a “growth” profession. Less than a third work for unions. Most of that “intercity” freight moves as “van” freight.

For five years during the 1990s, I was a controller for a flatbed company. After five years, I was struck by a vision to radically redesign how my company operated, and to change how trucking operates in the United States, and nobody has to live in their truck anymore. First, here is what happens today, and how it could work in the near future.

A Simple Vision

A load of freight moves from Seattle to New York. Today, a driver drives it to New York, or a two-person team will take it, to arrive quicker. In New York, a driver or team takes a load to Seattle at the same time. The trucks pass each other someplace on the Great Plains. If the trucks and loads were properly coordinated, twelve trucks could haul those loads from coast to coast, the drivers sleeping in their beds at home each evening. That is the idea in a nutshell, and it could work for the entire U.S. freight system. Below is a diagram to make it clearer.

Here is some elaboration. The Seattle driver gets up each day, goes to his yard, hooks up with his load and drives to Spokane. In Spokane, he drops his load, picks up a load bound for Seattle, and drives back to Seattle. He drops his load in the Seattle yard and goes home. That is his workday. A driver in Spokane does the same thing, except his route goes eastward. A load moving from Seattle to New York would be dropped and picked up by each succeeding truck, perhaps being hauled by twelve trucks by the time it gets to New York. A load from New York moves to Seattle the same way. That is the basic idea.

That concept would initially work best for van freight, which is by far the most common freight in the United States, and this essay will largely deal with van freight. Today, drivers prefer driving the same truck each day, which is understandable. In the system envisioned here, each driver could. Customers are not at the drop yard, but scattered across the Seattle area. Other drivers pick up loads in the drop yard, deliver it to customers, and bring loads from other customers to the yard. They are “local” drivers. As is evident, the difference between a local and long haul driver is minor. Drivers could drive long haul for a few days, then drive local if they became bored. With van freight, that would be an easy system to implement. With flatbed, tanker and refrigerated freight, there would be other complications, but they could be readily overcome with a little creativity. No driver would have to sleep in his/her truck, unless he/she really wanted to. That is the basic idea.

There are no objections to this idea that do not invoke ideology or incompetence as defenses. In the end, the only valid objection to this idea is people's [level of caring](#). If the lives of those people mattered to society at large, they could have them back, and not only would it cost relatively little to make it happen, the benefits to society could be vast. The basic idea could also be applied globally.

This vision came to me in a flash, at the end of a five-year process. Although it is not imperative to understand the journey I took to provide me to this vision, the footnote at the end of this sentence tells the story.^[1]

How It Could Appear in Practice

With technologies involved that are discussed at that above footnote, here is a more complete vision of a driver's day. The Seattle driver (Driver 1) lives close to the yard and can walk to work, or takes a bus with other drivers, or drives a half hour to the yard. That is up to the driver. Communities might spring up around

those yards across America, where those drivers can walk to work. Driver 1's onboard computer boots up as the truck is started, and the truck's location from last night is confirmed as his satellite dish verifies his location with the Global Positioning Satellite (GPS). Because the truck is in the yard, its radio has good reception with the national computer network, so the information that morning is transmitted by radio and not satellite. When radio signals are weak in the mountains and windswept plains, the satellite can relay information.

There is a national computer network with several mirror sites that contain the North American freight database. It is a real-time database. Each "node" of the North American system has its local mirror, where freight coming to, from, or through its region has its related information consolidated. As Canada has also joined the system, Driver 1 gets into his truck and might drive to Spokane, Portland or Vancouver, British Columbia that morning. Driver 1's profile is compared to the loads sitting in the yard (or about to be dropped there; a load that is only minutes away from hitting the yard can be among the loads that Driver 1 may take that morning), and the best load is chosen, taking into consideration the customer's needs. A load going to Butte, Montana, is sitting in the yard, at trailer space 25Y. Driver 1 drives to space 25Y and positions his truck to hook up with the van trailer.

The van trailer has barcodes on it, in several places, which uniquely identify that trailer. A load record was created when the load was picked up at the factory the afternoon before. The load record contains a complete description of the freight on board, including its weight, number of pieces (each with its own bar code, if it needs it). As the truck gets into position, a laser on the truck scans the trailer to ensure it is the correct trailer, and then the driver is instructed to hook up by the onboard computer. Driver 1 has an earlier model truck, as it is the early days of the North American Freight System (NAFS), and must back the truck up himself to position it. The newer trucks require the driver to sit in the driver's seat as a failsafe, but the truck backs into position on its own. When the truck backs into proper position, the computer notes the proper alignment (a laser on the coupling confirms proper alignment between tractor and trailer) and the female coupler on the tractor rises to engage the trailer's "king pin." The night before, the trailer was "jacked" into position by the same air pressure that also powers its brakes, when another truck dropped it. When the tractor's coupler engaged the "king pin," the trailer released the air pressure and the "jack" retracted, as well as the air system automatically connecting and engaging to power the trailer's brakes. For safety reasons, Driver 1 was still required to dismount from the cab and press a button on the trailer to verify that the hooking operation was properly completed, an operation that took less than one minute. The newer models under development even eliminated the need for the driver to get out of his cab.

Driver 1 is now off to Spokane. As he leaves the yard, the gateway laser scans the barcode on his truck and trailer, confirming that the proper truck and load are on their way, which can be seen as redundant, but that kind of redundancy is cheap in this high tech age, and can catch errors. Since Spokane was a possible destination for Driver 1, it would take about ten hours to make the round-trip to Spokane, and that driver was on the four-ten-hour-day schedule. Not all drivers wanted that schedule (it paid a little better), but those who did drove the Seattle-Spokane route regularly. As Driver 1 drove to Spokane, every five minutes his satellite dish and GPS assessed his earthly position and his radio relayed the information to the NAFS computer system. The information instantly updated the NAFS main mirror sites, as well as the node mirrors in Seattle, Spokane, Butte, Vancouver and Portland. The estimated time of arrival (ETA) of that driver in Spokane was continually updated, and when the truck had not moved for a few minutes, near Snoqualmie Pass, the NAFS computer sent an inquiry to the truck, asking what the delay was. The query was translated to audible words in the truck driver's headset, asking him what the delay was and how long he thought he might be delayed. The driver told the computer that the delay might be twenty minutes, because a car hit a bear and the road crews were still cleaning it up. The NAFS computer system instantly updated all databases with that information, and all trucks approaching Snoqualmie Pass from the west would receive warning of the accident (that could also be updated by the road crews themselves, as they are patched into the NAFS, as well as police, etc.).

As Driver 1 approached Spokane, Driver 2 from Butte was nearing Spokane. Driver 2 was a woman. The Spokane node's computer system analyzed the ETAs, delivery needs, drivers' profiles and directed that Driver 2 drop her load bound for Seattle in the Spokane yard and pick up Driver 2's load coming from Seattle. The ETAs of Drivers 1 and 2 were only a few minutes apart, and each driver usually ate a box lunch from home at the Spokane facility anyway, so they did not really need to drop and hook their loads in the three minutes that most trucks did. While eating lunch, Driver 2 met Driver 3, a buddy who was also heading back home to Butte. Driver 3's load could be directly delivered to the receiver on the outskirts of Butte, and Driver 3 got a call from his wife, who wanted him home a little earlier than usual that evening. He decided he wanted a load

that dropped right at the Butte node's yard, and Drivers 2 and 3 submitted their load switch through their trucks' computers, which the NAFS system analyzed and deemed appropriate for the customer's needs, and so was allowed. Last month they tried a similar switch, coordinating it as they drove, and the NAFS computer queried the customer on whether it was OK that the load be delivered a little later than planned. The customer stated that delay of that shipment was not acceptable, so the drivers did not make the switch that day in the previous month.

On the current day, with Drivers 2 and 3 switching loads, Driver 2 took the load directly to the customer's facility instead of dropping it at the Butte node. She did what the "local" drivers usually did, but the distinction between local and long haul driving was quickly disappearing. Before Driver 2 delivered her load to the customer, the Butte node's system directed her to pick up a load from a nearby customer and haul that load to the Butte node. Driver 3 got home a little early, as his wife requested, and Driver 2 made that delivery and pick-up, dropped it in the Butte node's yard and walked home to her husband and family. Driver 1 picked up a load bound for Seattle from New York in that Spokane yard. He did not deliver it to the Seattle customer, but dropped it in the Seattle yard and walked home to his wife and family. Below is a diagram to depict that day's work for those three drivers.

Example of a Workday of Three Drivers

Driver 1, to Spokane and back to Seattle Node

Driver 2, to Spokane, to Butte Area customer for drop, pick up another nearby load, and back to Butte Node for final drop

Driver 3, to Spokane and back to Butte Node

All across North America, the same scenario was happening, with drivers and loads synchronized in a marvelous harmony, a trailer being dropped in a node yard by one tractor, and another one picks it up a minute later. People might be surprised to learn that most of the technology and facilities to make such a scenario happen already exist and are in use today in the trucking industry. What does not yet exist has not been created because there has been no perceived need.

The Benefits

Principles I was bringing to integrating information flows and creating real-time management data in my trucking career were simply applied to create a vision to get all drivers home every night, if they wanted to. As explained in the [next section](#), most of the infrastructure to make the above vision a reality already exists. All cities already have truck stops and other trucking yards on their outskirts. Satellite dishes and onboard personal computers are becoming ubiquitous trucking accessories.

Today, more than one million Americans live in their trucks, and truck driving is projected to grow rapidly as a profession, the number will hit two million before long. It is not only they who will get their lives back. Drivers' children will get their parents back, and the driver's spouse will get his/her partner back. The hardships of being a sailor's wife or trucker's spouse are well known. For truck drivers at least, those hardships would become a thing of the past. Society also pays for the current situation in ways that may not be

obvious. What kinds of pathologies do children carry around because one parent is rarely around, or come from broken families as marriages disintegrate under those hardships? Millions of lives will immensely improve if the above vision became reality. Here are the immediate and easily quantifiable benefits.

1. Every driver will sleep at home every night. Some drivers desire the romance of running the roads. In the envisioned system, they could also do that. That romance runs dry before long, however, when they see that same stretch of road for the 50th time. Before long, nearly all have traveled as much as they want to, and would rather sleep at home and have a life. If they want to travel across the nation as part of their vacation (one of those trucker perks), this system could also accommodate it.
2. Out-of-route miles would probably decrease. Out-of-route miles are the miles driven in excess of the most direct route to deliver a shipment. My company had more than 10% out-of-route miles. Those miles are usually created to run a driver to his home, to spend a day or two, before hitting the road again. After fuel consumption, that was our largest controllable variable cost.
3. Deadhead miles would decrease. Deadhead miles are the miles a truck runs while not hauling a load. The distance from delivering one load and picking up another is what causes it. My company had more than a 10% deadhead rate. After fuel consumption and out-of-route miles, that was the third largest controllable cost. If there were a national freight system, what is known as "freight density" would increase greatly. Freight density is the geographic distribution of loads. Think of a map with dots on it, each dot representing where a load will be picked up or delivered. The more freight density, the more dots, and a delivery point would never be far from the next pickup point if there were enough freight density. That is one reason there needs to be some kind of national system, to have high enough freight density. If there were a national freight system with the kind of coordination this vision discusses, deadhead miles would greatly decline. [2]
4. Customer service would increase, with much more real-time control over the pickup and delivery of loads, and loads could move quicker under this system.
5. Fuel consumption would decrease, as drivers would not idle their trucks so they could sleep in them, for either heating or cooling. An idling truck burns about a gallon an hour.
6. With truck driving becoming a tolerable profession, the drivers' ranks would be cleaned up to eliminate poor drivers as well as criminals. Although my [ultimate vision](#) for the future sees that *nobody* is homeless, starves or suffers greatly, not everybody should be behind the wheel of a truck, as there is significant responsibility and danger in truck driving. Trucking companies were so desperate for qualified drivers in the 1990s that driver qualifications were often little more than a warm body and beating heart. That practice would end.
7. Other costs, such as maintenance, would decrease, as the management would be tighter, more intelligent and more real-time. The trucks would cost less, as the vast majority would have no sleeper attached to the cab, also meaning that larger loads and trailers could be hauled.
8. The administrative staff of running America's freight system would be drastically reduced, perhaps by as much as 80-90%. Those who would remain would have higher-level management skills than previously used in the industry.

Those are the immediate benefits. Some are difficult to put a price tag on, such as the cost of broken families and people killed by fatigued drivers. There are costs and considerations to make such a vision happen, and the next section will deal with most of them. If the lives of those millions mattered to American society, the obstacles are trifling and readily overcome. Virtually everybody could win. The only "losers" are criminals and drivers who should not be behind the wheel, and the upper hierarchy of trucking companies, including the owners, who will have to learn new tricks, and perhaps have to find new careers and investment opportunities. Also, most paper shuffling would disappear.

Costs, Considerations, Obstacles and Possibilities

On America's highways today, a sea of trucks can be seen hauling freight to and fro. Most is called van freight, where the cargo is sealed in a van. Larger companies have thousands of trucks. If companies came together to effectively form one trucking company, and the proper [information philosophies](#) were adopted, the above scenario would be easy to implement. A "drop and hook" could take less than a minute, and

drivers would be able to operate within a few hundred mile radius of their homes, with distribution centers in every city. The coordination of trucks and loads would allow a load going from coast-to-coast to be hauled by one truck, or dropped and picked up by twelve trucks in hardly more time (or could even be less), with the coordination of activities so sophisticated that the fleet and loads work in harmony.

There are costs involved with making that vision a reality, however. Here are the most significant ones.

1. Not all trucks have satellite dishes and onboard computers. Trucks participating in this program would need them.
2. The computer system to run the node-based system would need to be purchased and developed. The system envisioned here is only transmitting character-based information, not the multimedia data that is coming into vogue with broadband Internet access and the like. Running a character-based system would be a small job for today's computing power.
3. The quick drop-and-hook technology would have to be developed. It would not be much of a technical feat. The current slow, messy, greasy way that tractors and trailers hook up would have to be abandoned for a clean, quick, automated method. Current tractors and trailers could be retrofitted, and new ones would already have the appropriate gear. For new equipment, the elimination of the sleeper part of the cab would probably more than pay for the new drop-and-hook technology.
4. Putting barcodes onto tractors and trailers is easy. The laser equipment, placed onto the trucks, yards and hand-held scanners, would be more costly, but still cheap, especially when millions are placed.
5. Today, most of the needed land and facilities are located at existing truck stops. If this vision developed, fueling companies would be bought out, and their land used for node yards, as well as other carrier yards. The cost could be minimal.
6. Much of today's trucking management probably does not have, and probably never will have, the ability to develop and manage this envisioned system. They may be the most resistant to change, because they would no longer be calling the shots as they are today. They will have to discard old ways and attitudes in order to participate in the new system. There will be cost there, although its magnitude is partly dependent on their willingness to learn new ways of managing. Most likely, many people from outside the industry will have to be recruited to make it happen.
7. The same will be true for some drivers. Most drivers will substantially benefit from this system, while the criminals and drivers who play cat-and-mouse with management will probably not fit in. The truck stop and roadside culture will disappear, and those who depend on it will not like it much at first, but most who know that world will be glad when it vanishes. Similarly, today's union leaders have adopted an "us against them" attitude, while plenty of corruption and "selling out" has pervaded its ranks. Drivers are invited to look beyond a potential driver union as just another self-interest group. There is an opportunity far beyond just drivers getting their lives back, and it can go a long way toward [healing humanity and this planet](#). Union leaders and many truck drivers will have to reorient their thinking, and many will be incapable of doing it, but they can become a vanishing minority when the vision is comprehended and begins coming to pass. If an effort is made to ease the transition for all involved, however, nobody will unduly suffer, which is a major theme of this web site.
8. Today, long haul drivers work far more than a 40-hour week, for one of the only jobs in America that does. In this system, people will not work their lives away driving a truck. If everybody willingly pitched in, drivers might not get a 40-hour week immediately, but it would begin trending that way. As discussed below, there are some easy ways to pay for it all, and nobody needs to work themselves too hard.

As far as I know, those are the main costs involved with making the transition. Technically, it would not be a big deal. The most dangerous problem would be the wrong people making it happen. For all those drivers who think that trucking managers and executives are not too bright, I cannot deny it too strenuously. I thought I had seen abysmal management when I worked in trucking, but I recently consulted for one of the world's largest transportation organizations. Considering its scale and the number of professionals devoted to running it, it was run far worse than the trucking company. It can be argued that humanity, in its present state, is not capable of pulling off this vision. However, the ability of people to learn appears to be directly proportional to their desire to learn.

My [new president](#), who ended up delivering the final blow to the \$250 million trucking conglomerate I worked

for, looked at my driver bonus table one day. The bonus levels were presented graphically. The diagram had two axes, one for increasing MPG and one for increasing dispatched miles, three levels of each, for nine different bonus levels (imagine a tic-tac-toe diagram). My president said that he could not understand that diagram, and if he could not understand the graph, then the drivers could not either. My assistant controller and I talked to many drivers over the years before that new president showed up, and nobody needed to have that diagram explained. They understood perfectly well what it meant, as *it represented bonuses they could earn*. It was in their interest to understand that diagram, and they all did.

Technically, the most difficult part is developing the software for the national freight system. I have designed software myself, and know it would not be difficult, if people who knew what was happening designed the software. From my experience on the user and designer sides, it is evident that today's business software companies are plagued with poor design because few know the business, accounting, and data processing principles and see the bigger picture. Few true "architects" exist in the software industry. Most are "carpenters" who know how to pound nails, but have no idea how to build a skyscraper. Today, armies of carpenters design and build software, with few competent and visionary architects to be found. That is not only a problem in developing this envisioned system, but also for software in general. The [computer revolution](#) [has barely begun](#).

Today, there is a great deal of wasted technology, in trucking and elsewhere. Trucking companies will get satellite dishes and other high tech equipment, but not really know how to use them, or else they will use them at about 25% of their potential.

Many well-meaning people have advised me to "dumb down" my work into something that a fifth grader can fully comprehend, with two paragraph summaries of the various topics this site deals with. Attempts have been made to accommodate that concern, such as in this site's [introductory essay](#). A person can get this site's thrust in a few minutes of reading that essay. However, the slogan mentality is primitive, and sloganistic minds are easily swayed when somebody invents a sexier slogan or shouts theirs louder. This site does not seek that audience. Slogans that drivers can put on buttons, such as "No More Nomads," or "Sleep at Home Every Night," can help, but to make this vision a reality, people will have their minds and hearts challenged.

There will be ideological objections to this vision, since it can be seen as incongruent with the capitalistic ideal. What ideal is that? The [lack of competition](#) between trucking companies? The shareholders taking a bath? No more profit motive? How inefficient government is?

One need not subscribe to [Michael's](#) notion of the "[Young Soul](#)" awareness theme, where winning is everything, to understand that competition and winning are major themes in American culture. That has not been a constant of human history. Nature is [far more cooperative than competitive](#) (does your liver compete against your spleen?), and [Darwin's "survival of the fittest" notion](#) is a projection of the young soul awareness onto the world that young souls see. The ideal of competition is a primitive notion. In practice, competition is fear-based, especially in economics. Our competitors can take away our jobs, and we can lose the roof over our heads and access to food. In a "winner" society, everybody can quickly become a loser. It has been telling to watch the world's richest man, Bill Gates, continually look over his shoulder at his competitors, afraid they will ruin his business, as Microsoft has engaged in many underhanded practices to wipe out the competition. If the world's richest man could not sleep for worrying about his competitors, who can?

This current system threatens the human race with self-extermination. How many winners will there be if that happens?

This trucking vision was not born from thinking of ways to beat the competition. One way to make this vision happen is for drivers to become owners, in much the same way that the employees bought out United Airlines. Companies could also come together in a spirit of cooperation.

The drivers could band together and buy out their carriers (many are on the ropes) and gain enough freight density to make this idea feasible on a national basis. Instead of committing hundreds of billions of dollars per year to making weaponry, the U.S government could help make this happen with a tiny fraction of that sum, and it could become a showcase for what is possible when people come together. Once van freight gets onto this system, with a little creativity all freight can get on it, and no driver needs to sleep in his/her truck, unless they want to. Each node can have a small facility for those sleeping over (a rare occurrence, with cots for

the overflow of the rare snowstorm “stranding”), there can be some sleeper trucks for when drivers want to drive across the nation on vacation with their families, and many other cheap ways to accommodate some of the “perks” of traditional trucking life.

Many of the best drivers have carved out their little piece of trucking hell and have made the best of it. They can get home every weekend while running big miles (and driving on stimulants, forging their logs and speeding to do so) and make more than \$50,000 per year. They may not initially like this solution, as it may seemingly threaten the life they have carved out for themselves. One of the greatest crimes of our society is [wasting genius and talent](#). In this vision, the best can still ascend, but the floor is much higher for the least able and motivated. When I have mentioned this vision to long haul truck drivers (I first published this idea in 1999, so nobody can try to patent it...this is free to the world), one instant response has been, “If we did that, we would not make as much money.” My response is, “Not if you organize.” When I have mentioned this idea to trucking executives, the response has been, “that extra pay for long haul drivers is combat pay.” My response is, “What if there was no need for a war?”

It is up to drivers more than anybody else whether this vision comes to pass. They are the people doing the work. [The means become the ends](#), and coercive tactics will ultimately fail to make this vision happen.

Of course, such a system will not be a secret one. The information in the national freight system will be as public as possible. Some customers do not want the nature of their freight known (those who still believe in competition), and the system could accommodate it. Drivers, however, will have access to all pay and operational data (perhaps with names kept confidential, at least until the paranoia is past), and they will all realize that it is in everybody’s best interests to cooperate. Those who are recalcitrant and want to play cat-and-mouse with their trucks and “management” should not be a part of this system (they would be the system’s cancer cells). Everybody can be on the same team, and everybody can win.

As [Donald Walsch’s god](#) told him, in societies of highly evolved beings, “dirty work” such as truck driving or farming or sanitation work is the most honored work. Only in primitive societies as ours are such jobs denigrated, relegated to the lowest paying and worst working conditions. It speaks volumes about the human race’s history. It is time to change, if for no other reason than that we are ushering in our self-extinction if we do not change.

Many technologies that can make the world a better place have been systematically suppressed in the name of power and profit. I am living evidence of it happening in the [energy](#) business, and this site clearly outlines similar dynamics in [medicine](#) and [other professions and industries](#). When technology suppression stops being business-as-usual, we will see the end of trucks, roads, pollution, environmental destruction, poverty and disease. What is keeping that world from coming into being is us. The easiest way to corrupt this trucking vision is by turning it into the new dogma. There will come a time, perhaps soon, when burning oil to get power will widely be seen as insanity. Also, paving over the earth to transport goods that people do not really need will be seen as crazy, especially when anti-gravity and free energy technology is available. If there is a lesson that I hope this vision can help us all learn, it is that we can work smart instead of hard, by cooperating we can achieve far more than we can by competing, and *everybody* deserves to have a fulfilling life, free of drudgery. We have far better things to do with our lives. If we care for each other, we *can* have it all.

Footnotes

[1] This footnote is more of a historical document than anything else, for those who want to see the path this trucking vision took to flashing into my head. It is not imperative to read this section to comprehend the vision this essay imparts.

During the summer of 1991, I was recovering from [the ordeal in Ventura](#). I had written a 100-page diary-letter as part of my self-therapy for healing my Post-Traumatic Stress Disorder. I had spent nearly a year in Ohio at that time, and again had to move across the nation during a recession. It was not easy finding a permanent position in Ohio. Even though it was the Rust Belt, more than half of the controller positions in the Dayton area were in manufacturing. I had not worked in a factory environment before, and did not have a prayer, not when a job ad would receive two hundred responses. During that year in Ohio I sent out several dozen résumés, and had the courtesy of receiving rejection letters twice.

Although I was not actively chasing my [free energy dreams](#) anymore, I always refused to work in certain industries.

Dayton is the home of Wright Patterson Air Force Base, but I never considered working for them or the many defense contractors in the Dayton area. Similarly, in Seattle, during the several times I have looked for work there, I always refused to consider working for the timber, mining or aerospace ("defense") companies. I did not tell recruiters that I did not believe in those industries, but would say I did not see a great future for them. Idealists and corporate America do not mesh well, [as I quickly discovered](#).

After nearly a year of looking for permanent work, I finally landed a job in Columbus, Ohio in the summer of 1991 as a trucking company controller, and worked there for more than five years. During my tenure, we grew from slightly more than \$30 million in annual revenues to about \$45 million. [At a medical lab](#) in Los Angeles that I worked for the previous year, I was the main number cruncher for a \$100 million organization, but I did not quite have the opportunity that the trucking company offered. They fired two controllers during the year before I began there. The company never had a competent controller before. As with most of my career, I immediately began working sixty-hour weeks. I worked nearly every weekend of my first year there. From a controller's perspective, the place was in a shambles. My first three years there were my career's most satisfying. I liked whom I worked for and with, and I was able to help them.

When I moved to Los Angeles after my first [Seattle fiasco](#), I tried getting into the computer consulting division of a "Big Eight" CPA firm. If I had one more programming class, I would have gone that route and not the controller/accountant route. I always had an interest in computer systems, particularly how information systems work, and have always been a "big picture" kind of guy. I immediately dug my hands into every area of the trucking company that I could. There were some areas, however, that were off limits to me, which delayed the insight that I arrived at five years later. Most of the company was oriented around our computer system. We were linked to a main computer at a sister company.

A company with a virtual monopoly vended the software. They vended for hundreds of trucking companies, and even some of the largest (often the biggest companies develop most of their own software). Immediately, I began designing software modifications, working closely with the chief programmer, who also ran the data processing department. During my five-year tenure, I submitted hundreds of programming requests. I designed some systems from scratch, inventing systems where none existed. Understanding the company's big picture was essential to developing the best systems, because a change could impact several areas. The company had departments such as safety, operations, owner-operator settlements, payroll, billing, receivables, fuel tax, personnel, maintenance and the department that I built from scratch, accounting.

As with [Dennis' company](#), working there was like juggling ten knives at once. From the moment I arrived (usually at about 9:00 AM) until 5:00, was a continual whirlwind of activity. From five until eight or nine, I performed the detailed work that accountants do, in uninterrupted peace. The management at the company was rather weak, and the organization was essentially run by a handful of us, with most employees unable to make any decisions. I worked at upgrading that environment. Because I was getting my hands into numerous areas of the company, I could see things others could not. Each year, during the course of my duties I did something that saved the company more than my annual salary. Also, what I saw was not seen by our sister companies. We were one company of several that totaled about \$250 million per year in revenues. Through my CFO I told my sister companies what I discovered and how it could save them money. Sometimes I told my counterparts directly. Sometimes I was heeded, and at other times ignored, because nobody at my sister companies saw the broad picture I did. It could be frustrating.

When I arrived, the company was losing money. A handful of us were instrumental in making the company almost immediately profitable. My impact was felt and appreciated. It was fun. My president was at retirement age. I learned from him and liked the man. He was from the old school, however, and never really appreciated how critical our information systems were. He often boasted that he did not need computers to run the business. Trucking, as with the airline, telephone and electric industry, was known as a "regulated" industry. That meant the government set prices and managed the competition, which meant there was not any. In communications, it was a de facto monopoly, as with Ma Bell. In the electric industry, which is only now being deregulated (with companies like [Enron](#) taking advantage and raping the public), it was a local monopoly in every market. In trucking, there were quite a few companies, but no competition. Each company had its own routes, with government-set prices. It was similar to the airline industry, but not as glamorous.

Industry regulation set prices based on cost plus a "reasonable" profit. With no competition, regulated industries were virtually guaranteed a profit, which was based on their costs. The incentive for those regulated industries was having their costs as high as possible, because the greater their costs, the larger the profit the government would build into the pricing structure. In theory, the government regulated those industries by also regulating their practices, such as their cost structures. In regulated industries, a phenomenon happens known as "[capturing the regulator](#)." It extends to pharmaceuticals through the [FDA](#), [agribusiness](#) through the [USDA](#), banking [through the FDIC and other bodies](#), [insurance](#) through the state regulatory bodies, [CPA firms and the SEC](#), etc. Because money and power corrupts, the regulators end up protecting the interests of those they regulate, not the public's. It is well known in every regulated industry. Government is always fighting capture, but the regulators themselves *desire capture*, as corruption

pays well.

The [airline industry](#) is higher profile than trucking. Pilots were the elite of the transportation industry, while truck drivers had gritty jobs. When deregulation happened in the early 1980s, competition became fierce between the airlines, for a while. Numerous small airlines came into existence and began competing with large airlines. Airfares began a steep price decline. Deregulation is what made flying affordable to most Americans. In a regulated industry, everybody does well. Suppliers do not manage their costs, employees make good money for what can be easy work, managers nearly sleep on the job, and it is a gravy train all around. Government work is often similar.

When deregulation happens, however, new competitors get into the business, and companies that formerly had an almost fond regard for each other, as they were forbidden to compete, now found themselves facing each other in a "free market." A new deregulatory environment or new industry, as with microcomputer software, is the closest thing to a free market, from the producer side. It never lasts long, as the case of Microsoft demonstrates. [Standard Oil](#) in the 1860s and 1870s is another example. There were initially hundreds of small oil refiners. By 1879, John Rockefeller bought out or wiped out his competitors and controlled 95% of American refining, which was the oil industry's critical link. By controlling refining, Rockefeller controlled the entire industry, as all oil passed through his hands. Microsoft's attempt to wipe out Netscape and become the leading Internet portal is similar. Even the breakup of Standard Oil did little to change things, as a few big players colluded with each other, which is standard oligopolistic practice. Recently, two of those Standard Oil companies merged back together, creating the world's largest oil company (Exxon and Mobil). [Capitalists hate competition](#). They always have and always will, because competition makes for an uncertain future and is hell on profit margins. Only in monopoly or oligopoly situations can companies rake in big profits, as Microsoft does today in its monopoly position.

In the wake of deregulating transportation, the airline industry was a free-for-all for a few years. Then the airlines bought out their smaller competitors, wiped others out through predatory pricing strategies, and the industry is consolidating. I recently worked in the travel industry, and old salts told me that the few large airlines often raised and lowered their prices in unison, evidencing collusion. The collusion does not have to be a conspiracy held in smoke-filled rooms, although it can be. The few players can come to a mutual understanding of how the game is played, and each knows their role as they all rake it in. When the owners of professional American baseball teams were convicted of a conspiracy in the early 1990s, when no free agents could seem to get an offer from another team, nobody has since come forward and admitted the conspiracy. Perhaps they did not all meet at a secret meeting to hammer out the conspiracy, but could all smell which way the wind was blowing, and played their part.

The few large airlines, which control nearly the entire American flight market, might wink and nudge each other while raising and lowering their prices in unison, periodically staging a "price war." The airline industry's suppliers have acted similarly. Through mergers and other aspects of today's capitalism, there is only one commercial airplane manufacturer in the United States: Boeing. They have only one competitor: Airbus. Suppliers of regulated industries also have little incentive to manage their costs, as they are merely passed along in the retail price of the product or service. Boeing is a tremendous bureaucratic organization, structured much like a government agency. Companies like Boeing are why *Dilbert* exists. Boeing is also the second largest contractor in the last big regulated industry, [the military](#).

Companies in regulated industries have little incentive to modernize their practices or technology. Hence, regulated industries are rife with ancient management structures and styles, often have old technology, and are highly inefficient. When deregulation happens, the race goes to the quick, for a while. Trucking was a much more fragmented than air travel, with hundreds of large trucking companies, and much lower barriers of entry (the biggest barrier is usually the money it takes to start a company). In the decade after deregulation, the competition in trucking was fierce. There were not only hundreds of new companies, but also the formerly gentlemanly manner in which the big players dealt with each other became a battle to the death. Ten years after trucking was deregulated, one third of the hundred largest trucking companies were out of business, casualties of the fierce competition. Those companies that could not adopt competitive practices, such as modernizing, bit the dust.

The ranks of trucking companies, however, were filled with managers whose careers were built during the regulated days. Consequently, most had no idea how to modernize. My president's anti-computer sentiment was not unusual. Some business practices I saw were thirty years behind the times. Many executives and managers were formerly truck drivers themselves. They were injured on the job, brought into the office, and worked their way into management. The trucking industry is also one of the last bastions of male bigotry, as trucking is largely a man's job. The macho mentality often dominates the thinking of truck drivers and management, with morning greetings often accompanied by swear words.

Having "[home grown](#)" managers in one sense was positive, but in another was not, because they had little or no professional training. Getting a college degree is not all it is cracked up to be. All the same, those who have been through the college experience during the past generation are usually not afraid of computers, and know they cannot run

a large company without them. Like a truck, a computer is a tool. Used properly, it is awesomely powerful.

I was amazed at how poorly designed the software that the industry leader vended was. Software bugs or poor design are why computers make "mistakes." Computer nightmares usually pertain to software design, although poor hardware design can contribute. There can also be compatibility issues.

The bedrock principle of all data processing is "garbage in, garbage out." If inaccurate or meaningless data is input, so will be the output. If the system is not designed to get the best possible data input, the rest is meaningless, a phenomenon I have seen many times in my career. It is one more instance of [forgetting the basics](#). It is similar to building a huge, ornate house on a foundation of sand.

Trucking needed better information systems than almost any other industry, because it operated in a real-time environment, spread across the nation. Ours was a typical mid-sized trucking company, with hundreds of trucks crisscrossing America, and the goal was getting the best load under the nearest available truck going to the right destination at the right time. Making that system work effectively required an awesome amount of communication between driver, shipper, receiver, and the company that coordinated it all. Not only did we need real-time communication, we needed a sophisticated system to figure out what load should be taken by whom and when to where. Without a sophisticated communication and information system, the trucking company's effectiveness and efficiency would be abysmal. Most companies were in the same boat however, so they were "competitive." Even when we began getting better information systems in place, we regularly saw a customer's load fail to be hauled for lack of a truck, while a few miles away a truck sat at a truck stop overnight, empty, because we could not find a load. That blundering was costly.

The largest controllable variable cost in a trucking company with employee drivers (not independent contractors; my company had both) is the cost of fuel. The largest factor is not the fuel price. By far, the largest variable is the driver and how economically he/she burns the truck's fuel. For instance, with our company fleet, a truck's MPG could be as high as seven, or as low as four and a half. That is a tremendous variation. At a fuel cost of \$1.20 per gallon and at 120,000 miles driven in a year, the variation between the fuel cost of a driver getting 4.5 and 7.0 miles a gallon is more than \$11,000 dollars. For a truck that might contribute \$30,000 to cover indirect costs in a year, \$11,000 dwarfs all other variables. I never saw a company that had a timely and accurate way to measure its trucks' MPG, except for the system I designed.

When I began, we only had owner-operators, but during my first year we inherited a company fleet from a sister company that we closed down. I had to develop systems to manage a company fleet, where for the first time we had to worry about the costs of fuel, maintenance, driver wages and a multitude of other factors that go into running a truck profitably. With owner-operators, we merely took a cut of the retail dollar to process the paperwork, while the owner-operator not only managed his truck, but also often secured his load through our agency network. I developed a system whereby the card used to buy fuel was interfaced with our computer system to calculate MPGs. The interface already existed, but none of my sister companies were using it to calculate a timely MPG for their trucks.

Truck stops enticed drivers by giving them free showers, meals and other goodies if they bought a minimum of fifty or a hundred gallons. A truck held between 200 and 300 gallons in its tank, but many drivers would put in that fifty or hundred gallons every day or two, and get the free goodies. That was a normal part of the business, but a truck's MPG could not be calculated unless one knew how many gallons they *consumed* in a period, not how much they put in their tank. I devised a method where the driver gave the fuel desk some information. The driver would give the fuel desk his truck mileage, as given by his hubmeter or odometer, his unit number, and a "p" or an "f", meaning if he filled his tanks to the top ("f"), or only partially ("p"). We could perform an MPG calculation between each "f" because when a driver fills his tanks, we could calculate how many gallons went through his engine since the last time he filled them (unless he had a leak, sold his fuel or had it stolen). We required our drivers to fill their tanks to the top once a week.

The fuel desk also transmitted data captured automatically from the fuel pump, such as price per gallon, gallons pumped, the location of the fuel station, etc. With that data coming online, we had timely data to calculate fuel consumption on a nearly real time basis. None of my sister companies, who had much larger company fleets (several hundred trucks), had anything like it. They simply could not tell what a truck's MPG was, accurately or in a timely manner, or see any trends. It was the largest variable cost the company had, and they had no way to even begin managing it. It was common throughout the industry.

I developed a system that took advantage of information flows that already existed, added some other data to it, and had a gold mine of information. That system also created the need for sophisticated analysis. One problem was drivers giving the incorrect unit number, the hubmeter reading being keyed in incorrectly, or the driver giving an "f" when it was really a "p." Those problems necessitated an analyst examining the data and correcting it.

I developed a report by truck that showed a truck's MPG, who the driver was, where they fueled and when, and I could look at it and see the MPG going up when a driver was deadheading (driving with an empty trailer), see it go down when he took a trip over the mountains of the West, or even when he was driving into a headwind. I could also see it go down when a driver used his engine to heat or cool his cab. It was information that no other company I saw had.

The data was valuable, but was only the first step in managing the problem. While I rode herd on the process, working with fleet operations, we would ask a driver what the problem might be for his low MPG, or how he got it so high. We uncovered problems such as a driver not really knowing how to shift his truck properly, or a truck that needed its fuel injectors overhauled. Once I had the system running, it only took about an hour per week of debugging and analysis to know who to ask which questions, and we could begin managing our fuel consumption. For the huge companies, what I developed may not have been news, but for most other companies I was venturing into a world that nobody had seen before. Those above me often could not appreciate what I was doing, and how for an hour a week of an analyst's time they could have timely and accurate information on the fleet's fuel consumption. We made the drivers responsible for their MPG. They drove the trucks and knew best what was happening. I developed a bonus program for rewarding drivers with high MPG and high productivity. The drivers then became very interested in their MPG.

Mine was not the industry's first MPG bonus, but it was run off the most accurate and timely data. Some of our better drivers, to keep their MPG and bonus high, would hang out inside the truck stop instead of burning up a gallon an hour to keep their engine running to heat or cool the cab. My program was having an impact. We eventually had nearly 200 company trucks on the road. Yet, it was always a battle to keep somebody focused on managing the fleet fuel consumption. We never devoted much effort to it because it never became a management priority. We spent millions of dollars per year on fuel, and all I asked was a couple hours a week by one person, and they could keep an eye on fuel consumption and manage the problem trucks and drivers. The cost/benefit of my program would have easily been ten times the return for the effort put into it. It could have been much higher, but it never became a priority because the idea of managing fuel consumption was alien to the industry. Drivers managed it by default. I proved that it was not difficult to get timely and reliable information to begin a management process, but I was a voice in the wilderness. How much fuel is wasted across America because trucking companies are not actively managing fuel consumption? It is many millions of gallons per year, easily.

There were several areas where I made innovations such as that. In calculating miles driven for fuel and mileage tax purposes, again the software company vended a "system" that my assistant controller called dog excrement. A programmer from India spent an entire hour or two designing the system. The fuel tax area was off limits to me for years, and I eventually inherited it and discovered how bad it was. We were losing more than \$30,000 per year in uncollected taxes from owner-operators and state audits. I invented a system that eliminated data entry error, had the computer do sophisticated calculations, again spitting out exceptions that took some analysis. Our annual loss fell to about zero. As in the fuel consumption area, I could have further refined the fuel tax system to eliminate more errors and reduce the time spent debugging the data, but with the other fires I was fighting, I did not have the time. When I inherited the system, our mileage error rate was ten percent, as deduced by the state auditors who took a chunk of our hide each audit. My system had less than a one-percent mileage error, and required only a third as much human effort, to create the data and manage it, as before.

Again, however, there was a problem. The old system used people as drones, having them do rote procedures that the computer could have done faster and more accurately, and I replaced the drudgery with a process that required much less, but I also created an analysis step, and the software was more sophisticated. I created a system that needed intelligent management, but it richly paid off. The driver put forth no more effort than before, and the system was more fair and accurate. Ex-drivers generally could not manage a system such as that. We needed some sophisticated management. That was my trademark in system design. I would replace five drones with drone-like one job, entering data into a sophisticated system that minimized data entry errors, and needed one analyst to manage it.

By itself, it was a great improvement. There was a downside, however. My ideal was eliminating rote jobs and replacing them with fewer jobs, but jobs in which the employees could exercise their brains. It was unusual for the person doing the rote job to be capable of performing the thinking job. My systems needed higher-level skills to manage. A big problem was upper management not understanding that. Yet, while I was there I could keep the systems online, I was training my assistant controller to take my job someday, and he understood what was happening. I was trying to upgrade our management practices, but had to continually deal with managers who could not go there, because they were drivers who hurt their backs and had become managers.

In addition, the great crime [of today's capitalism](#) is that it does not share the wealth. My innovations made jobs that took less effort to perform. By definition, that is an increase in wealth. All too often however, corporate America axes bodies in the wake of such innovations, and makes higher profits, giving out huge perks to the executives. America has by far the greatest disparity between executive compensation and worker wages of any industrialized nation, and it became dramatically worse after [Reagan](#) took office. If corporate America invested more of that increase in wealth into

its people, or spread it around society, such as eliminating the indefensible scandal of homelessness in America, the richest nation of all time (Cuba has no homeless people), we would have a chance at becoming a truly "great" society. Innovations such as mine too often become a gold mine for the rich, or a way to crack the whip better on the employees.

The software company did not have a data integration concept. They had modules such as operations, settlements, payroll, maintenance, etc. They brought some data into one module from another, but far too often we ended up entering data, such as a hubmeter reading, into several different databases, when there should have been one that all fed and used. The data would churn through a module and be dumped out in a big report that nobody looked at. I often saw that data from one module was not sent to another. The information could not interrelate and produce more comprehensive and meaningful data. By integrating the data that way, it also meant that higher-level thinking was involved in analyzing it. That thought process had not been used at my company, and had not at every trucking company I had seen. That industry-wide software that everybody worked with also evidenced it.

After I had been there nearly four years, we performed a system conversion to the new software version (after preparing for nearly a year), and much to my chagrin, I discovered the modules that the company vended from ten years earlier had not been modified at all, and our software was vastly better than what the industry leader had. We could not avoid the conversion, because the new software was written in a newer language, so we made the plunge. We had to take big steps backwards to convert to their "new" software, and spent frantic months recreating the modifications we had made. I was burned out by nearly five years of sixty-hour weeks, capped off with that nasty conversion. It was then that I had my breakthrough of insight. I eventually became involved with nearly every aspect of the company, but the safety department was still off limits, although we had a parade of ex-drivers and ex-policemen waltz through the position of safety director. They were non-managers. In my final year there, I was finally able to sink my teeth into the safety area. What I saw shocked me, but also led to my breakthrough.

There are inherent conflicts between corporate interest and the public interest. Corporate America constantly sacrifices people, resources and the environment in pursuing the [holy profit](#). There was a major conflict of interest in trucking. When trucking was deregulated, the same thing happened as with the airlines, except it was not as high profile. Rates declined in the fierce competition. In trucking as in air travel, the consumer was the big winner. "Cost control" does not have to be a dirty business. The regulated industries were extremely wasteful. As with the [other rackets](#), the most powerful pigs get access to the trough. The people who paid the most for the cost control were the people doing the work: the drivers and clerks. As rates declined about thirty percent in the decade after deregulation, so did drivers' wages. It went from a good-paying industry to a low paying one.

Truck drivers today are in a bad situation. Virtually every driver would prefer having a job where he/she sleeps at home every night. Consequently, "local driving" jobs are coveted, and if a driver gets one that pays well, he/she will hang onto it forever. Most local driving jobs pay poorly when compared to "over-the-road" trucking. Five years ago, a local driving job paid \$10 per hour at most. Long-haul jobs paid slightly more than \$30,000 a year. Those are the averages, and today are somewhat higher. Unionized truck drivers make much more, but again, people usually have to "know somebody" to get them. I have seen non-union over-the-road drivers make more than \$50,000 per year, but they are unusual. The average driver is in a bind. They can get a local job and fail to support their family, or go over-the-road and make \$10,000 more per year. They give up their lives, however, and road expenses eat up a large portion of that pay increase, similar to what daycare does to a mother who works outside the home.

Many drivers go back and forth, driving long haul, but their marriages and private lives begin falling apart. They are home only a few days a month, and they then take a local job. They cannot make ends meet on local job pay, so they go back to long haul. They are stuck in a no-win situation, one I have seen many times. Over-the-road drivers are paid by the mile. The more miles they run, the more money they make. That encourages two dynamics: drivers driving fast and recklessly, and driving more hours than they should. Both endanger the driver and public. Trucking companies have introduced controls such as programming trucks so they cannot drive more than 65 MPH or so. Truck drivers constantly play a cat-and-mouse game with law enforcement, with anti-radar technology, citizens band (CB) radio to warn each other of "smokies," etc.

Also, companies are often paid by the weight of freight hauled, so there is an incentive to overload the trucks, both from the customer's and trucking company's perspective. Trucks are often overloaded, which makes them more difficult to maneuver, making them dangerous. Highway scales try to enforce the weight limits, but avoiding scales is an art form, and drivers have told me funny stories about how they avoided scales, even wiring their trucks so they could turn out the running lights as they snuck past scales by taking side roads at night.

There are laws regarding the hours a driver can work, and they are designed to limit driver fatigue, which is a big cause of truck-caused accidents (although officially it is small). When I was in the business, and it has changed little since then, most drivers drove more than the legal limit in hours. A driver must complete logs that show what hours he/she

works, sleeps, drives, and where they were and when. A fueling stop is supposed to be logged, as are pick-ups, deliveries and other events. Most drivers forged their logs. They would fake log entries to appear as if they kept within the legal parameters, although they might really work many more hours in a week than they were legally allowed. They often kept two or three sets of logs, one for each situation (one to record "reality," one to hand to police and other officials, and one to submit to the company). Those drivers take caffeine and illegal drugs to stay awake, and are often the drivers who kill people. The system encourages it in many ways.

Companies are supposed to audit drivers' logs to ensure proper completion and check for falsification. Falsification is detected by comparing the logs to available information. When a driver stops for fuel, the receipt states the time of day, as do toll bridge receipts. Employee drivers would turn toll receipts in for reimbursement. The company was supposed to compare the document to the log, to see if the driver was properly recording the event. Drivers would invent ways of beating the system. Some of our best drivers (at least from a productivity standpoint) would whiteout the time/date stamp on a receipt. When I discovered that, we stopped accepting such receipts for reimbursement, which halted that practice.

There were numerous pieces of data available to audit the logs. One was the bill of lading, which documented the changes in load custody from pick-up to delivery. In our office, mountains of paperwork floated from the settlement and payroll departments to billing, fuel tax and safety. What happened in safety was a mystery to me for years, because I was not allowed to go snooping there. When I finally did, I was shocked. For starters, I found that the piles of paper that went into the safety department were gleaned for certain information, and every day's log for every driver was entered into our system, with error codes if an error was found. It was easy to develop a program that reported how many logs a clerk entered into the system, and what errors they found. In my five years there, no safety supervisor ever asked for that. I immediately had our programmers develop a report that the safety supervisors could run, and it was illuminating. Some employees were quite productive, while others were not. It validated some suspicions, while also providing surprises.

The real shocker, however, was what I discovered about log auditing and falsifications. Except for falsification, looking at the log alone could discover every potential log error. The pile of paper that accompanied the logs was for one reason only: detecting falsifications. When I ran the program I looked at error types, and falsification was absent. For the three months that I reviewed the data, not *once* was a log falsified. There was something wrong. Either the drivers never falsified their logs, which I knew was not true (our fuel tax department caught them), or our process was ineffective. A driver who regularly falsified his logs figured out the system, and never submitted his logs with documents that could falsify them, and our process rarely and poorly attempted overcoming that. If a log clerk received logs without the other documents, he/she audited the log without them.

Once I realized what was happening, one day the lightning bolt hit me. All those areas where I had revised and refined our systems, all those principles that I had used before in designing information systems that not only made life easier for those used as drones, but gave us more accurate and timely data than before, all came together in a flash.

At our company, a delivery receipt (similar to a bill of lading, but just for the delivery) would first go to settlements, where it acted as proof of delivery, so we could pay the driver (drivers were paid upon delivering the load). It would then travel to billing, where the date of delivery was entered, where we also logged in the proof of delivery, which some customers required. Then the proof of delivery would travel to the safety department with the logs when they came in, for falsification purposes. Then it would go to the receivables department where it would be filed. That was partly because trucking companies were often organized departmentally that way, and reinforced by the trucking company software. A driver's log would go to settlements and payroll first, then to safety, then to fuel tax where the log points (fuel stop, delivery point, etc.) would be entered. I devised a system that had a mileage program calculate the miles between the log points, which compared them to the driver's trip records. Mountains of documents made that circuitous route through the company.

In that flash, I had an insight that stunned me. The ideal is that a document should be handled only once, and the pertinent information entered from it. Then it goes directly to file. That was not a unique realization in itself, and was not really mine, but is a corporate ideal these days. The vision incorporated that idea into something far grander. In what I saw, the computer system then took the pertinent data and sent it to where it was needed. The various departments did not handle any paper, but instead dealt with the data coming from those documents and other data sources, such as the truck stop fuel desk. The data was integrated and manipulated to give us what we needed. We needed a new department known as Central Paperwork, where the data came in, was entered, and the documents filed. The raw data needed for settlements, payroll, billing, receivables, fuel tax and safety would all be entered in the same place. If done properly, the other departments never needed to see the documents. Also, there were numerous front-end edits that would have ensured the integrity of what we entered, where various algorithms and pieces of related data would be used to validate the data entry, making it virtually impossible to make a data entry error.

In log audits, for instance, the last place I looked into, I envisioned a system much like the one I designed for fuel taxes. Disparate information came from several sources, and the sophisticated programs performed the comparing and validating, spitting out possible errors or falsifications, which were resolved by an analyst. It would take a human decision to call something falsified. We finally would have a system that caught log falsifications. My vision went far, far beyond a major reorganization and streamlining of the document and information flow. Again, the structure of the information systems was linear, with various processes taking place, seemingly unrelated, but in reality all part of a big picture that nobody was seeing because the data was not properly integrated. I designed other systems, such as one in our maintenance department that would give us levels of information we had never seen before, and few companies had ever had before (if any, although I imagine some big ones did). I designed a system that would give us maintenance-per-mile cost by driver, by truck, by component (even by brand of component), where we could begin seeing trends that were previously invisible.

The grand vision was how we could finally begin managing our trucks on a nearly real-time basis. The system I envisioned would bring data such as out-of-route miles and rates, MPG, maintenance costs, delivery experience, claims (damaged cargo) data, deadhead miles and rates, driver needs (such as when he was last home), etc., into one screen, where the big picture could be seen, with nearly real-time, reliable data. Then we could begin really managing our trucks. About the only time we could really manage the truck was when we had the driver on the phone (satellite dishes make that contact much better). If that data was in front of us when talking to the driver, the management possibilities were immense. I saw a way to create more meaningful data, more quickly, using far fewer resources than we had ever devoted to running the company's administration. It was a radical vision, and we were already most of the way toward producing such a system. The raw data was largely there already. It just needed reorganization, and needed the chief programmer and myself to spend a couple months doing design and programming of critical parts. In the end, we would have had timely and reliable information at our fingertips, and I would have eliminated numerous drudgery jobs and replaced them with a few analyst jobs.

There were downsides and challenges. None of my earlier innovations led to any layoffs, but that one might (it could have chopped our administrative staff in half), which was not my goal. My earlier innovations meant that we could do more work without adding more people, and I created jobs that needed problem-solving ability. The other was the double-edged sword that happens in capitalism. We would have had much more knowledge and control over what our trucks were doing. On one hand, it could have been wonderful, not only for us, but for the drivers, as we could have seen problems developing, such as declining MPG, and could have resolved them early. Such remedies included injector overhauls, and it also would catch drivers who sold their fuel.

Unfortunately, somewhat less than one percent of the driver population is criminal, and they would sell fuel, sell the tires off a trailer, sell off the load, etc., but they would do it for a week before anybody caught on. Yet, it also could have been abused to turn the drivers into virtual slaves, us watching their every move, turning down the screws. In unscrupulous hands, it could have turned out that way.

The only valid concern I ever heard about that vision for streamlining my company was from my assistant controller, who astutely observed that if we got a handle on hours of service and could find forged logs, the cheating drivers would all quit and work for somebody who let them drive eighty hours per week. It was a valid concern, and one I had already accounted for. We *had* to know what was happening. .

Not only was there a duty to the public, I was a corporate officer and I could go to jail for letting a driver kill somebody, when I had information that could tell me he was driving eighty hours per week. The duty to public safety and my own hide were more important than some drivers leaving. Our drivers had accidents that killed people several times while I worked there, and as I looked at photographs of people who our trucks had killed, I felt that whatever our company could do to make sure that never happened again was worth it. The safety measures we enacted not only saved lives, but also were far cheaper for the company. The cost of killing somebody might be borne by our insurance company in the short term, but in the long term we paid for it in rising premiums and other costs, such as perhaps going to jail, which some unscrupulous trucking executives are doing today, as they conspired to circumvent the hours-of-service laws.

Probably the biggest obstacle of all was the people I worked for. I presented my ideas to my new president, a salesman who repeated his predecessor's mantra: he did not need computers to run the company. I presented the ideas to those above me, even to the parent company's CEO, and all I received were blank stares. They had little idea of what I was talking about. They did not really understand the business. I soon stepped down as controller, my protégé took my place as planned, but he quit soon after, in the horrid environment that existed. The new president chased away most of the company's talent within a year. All the systems I put in place were taken over by people who had no idea about how they worked, or what the goal was. I heard that they all ended up in shambles. That was depressing.

That new president hired a compliant controller and they let the accounting systems disintegrate. Consequently, and probably not entirely accidentally, they hid more than a million dollars of losses (from their incredibly poor

management practices) in the accounting system's wreckage, and in late 2000 there was a public scandal over what they had done, and a few months later the entire \$250 million organization closed its doors, that scandal being the final blow. All the sister companies also ran inefficiently, for the reasons I have highlighted, and a spike in oil prices killed off that dinosaur that tried surviving in the last warm valleys. It was preventable. Thousands of people lost their jobs in that meltdown, largely due to the incompetence of upper management. It was awful to watch it happen from a distance, and see careers capsize of those I once worked with.

There were many other aspects of my vision that this essay has not covered. The systems could have been continually refined until we were running on all cylinders, and what is presented here was a fragment of the vision that came to me.

[2] On a national basis, with the United States being a net importer and having regional industrial and agricultural centers, there would be more net freight moving more one way than another at times, but having half-trailers (called "pups" in the industry) would mitigate that kind of deadheading, as in a driver could haul a full pup and an empty one, or taking trailers back by rail to where the greater freight density is, something less feasible with our current system.

The More Things Change, the More They Stay the Same

The upper photograph was taken in 1915. It depicts the lynching of William Stanley in Temple, Texas. The photo was made into a postcard, which was a popular use of lynching photos in those days. On the back of the postcard was this caption: "This is the barbecue we had last night. My picture is to the left with a cross over it. Your son, Joe." (see the book *Without Sanctuary*, plates 25 and 26)

The lower photograph was taken in 2005, in Iraq, and it depicts an incinerated Iraqi, surrounded by U.S. Marines posing for the folks back home. The photo was posted to a website used by U.S.

The top photograph is of Sabrina Harmon posing next to the corpse of Manadel al-Jamadi, an Iraqi who was tortured to death by U.S. Navy SEALs at the Abu Ghraib prison. Charles Graner is posing next to al-Jamadi's corpse in the lower photograph.

This photograph is of an Iraqi girl who lived in southern Iraq, who was one of the first victims of the U.S. invasion to "liberate" Iraq. We liberated her foot.

.....
military personnel, who post pornographic photos of their wives and significant others for the enjoyment of their fellow soldiers. The caption for that photograph was "cooked Iraqi."

A Note to My Critics

By Wade Frazier

[Introduction](#)

[False Dichotomies, Straw Men and Name Calling](#)

[Conspiracy Theories, the “Company I Keep,” Presentism and Dennis Lee](#)

[Threadbare Rhetorical Devices](#)

[Footnotes](#)

Introduction

I have often solicited it, and many have provided valuable criticism of my work over the years, both constructive and otherwise. However, most of the unsolicited criticism I received contained serious errors of logic and other flaws. If critics of my work wish to have their criticisms taken seriously, they need to read this introductory essay before they write their critiques.

I no longer have public email address from this site, largely because of “critics” from the public. After the [World Trade Center attacks](#) of September 2001, the [criticisms of my work greatly increased](#) in their frequency, irrationality and viciousness. Some were breathtaking, with the most irrational and uninformed coming from a self-proclaimed government “fraud expert” who called me a criminal while he tried to officiously intimidate me (I have [encountered his professional brethren before](#)). They were nearly all variations on killing the messenger, with open threats sometimes accompanying their diatribes. Those assailants succeeded in limiting my public dialogue, but they did not succeed in preventing this site’s completion. This site was largely finished in 2002 during a several month period when I had no public contact, and did not receive emotionally unbalancing attacks.

Cyberspace is a great equalizer, but having a public email address is like an author publishing a book and having his home address and phone number on its cover. With email, many feel free to make the equivalent of obscene phone calls, and threaten to come visit my home and kill my pets; such is the state of today’s America. In early 2007, I initiated another attempt to [engage the public](#). We will see how it works out.

False Dichotomies, Straw Men and Name Calling

Perhaps the most common fallacy of logic directed toward this site’s writings is a *false dichotomy*, also known

as *false alternatives*. It is the logical flaw that states that if something is not one thing, then it is another, when it is neither. I went to [business school](#) in college and fervently digested my indoctrination. I kept my eyes open after graduation, and eventually became acutely aware of how my indoctrination conflicted with post-graduate reality. I realized that [I had been sold a set of lies](#), not only about [capitalism](#), but also about most aspects of my world. I was a [capitalist who finally saw through the game](#). To some critics, that makes me a "Marxist." I have barely and only recently read any of Karl Marx's work. In addition, calling me a "Marxist" is an example of *argumentum ad hominem*, or name-calling. I am either a capitalist or a Marxist. That is a false dichotomy. There is no room for a capitalist who became disillusioned with capitalism. That same false dichotomy was handed to Americans for generations, with the continual Red Scare and the fantasy of being invaded by communist armies and conquered by the [international communist conspiracy](#). That might be the most untenable conspiracy theory ever concocted, but was an officially sanctioned one (a la McCarthy, et al.). In addition, Stalinism had little to do with Marx's work.^[1]

I have written about the brutal police-state tactics used on non-violent protestors at the WTO meeting in Seattle in 1999, the 2000 Republican and Democratic conventions and the 2000 World Bank and IMF meetings. One critic responded that I should be glad that I do not live in China, because they use real bullets on the protestors there, not rubber ones. That is about the most ethically bankrupt argument anybody can advance: the crimes our state commits are smaller than crimes that other states commit. That argument can be trotted out to justify any crime, and can be summed up with,

"Be glad I only raped you, he would have killed you!"

Such a rationale uses the crimes of others to justify ours. People can always dredge up the specter of Hitler and Stalin to justify our state's crimes, because ours were not as bad as Hitler's, Stalin's, or China's. What makes that fallacy of logic worse is that it is happening in my nation, not somebody else's. I can *do something* about the state-committed crimes in *my nation*. I can do far less about the Chinese government's crimes. Both the U.S. and Soviet governments used that type of false argumentation throughout the Cold War to silence their internal critics. Establishment defenders would point the finger at the other superpower, saying, "At least we are not like them. Do you want to live under their rule?" If I can point the finger at somebody else who is worse than me (in actuality or imagined), that seemingly relieves me of the initially painful revelations that introspection would bring, so *I* can improve *my* behavior. It is one of the oldest tricks in the book, the same fallacy that Jesus remarked on when he said that people look for splinters in their neighbor's eyes while ignoring the logs in their own.

In the wake of the [World Trade Center attacks](#) and the great irrationality that gripped America, a false dichotomy endlessly played out, even led by the White House: any attempt to understand the motivation for the World Trade Center attacks as anything other than George Bush the Second's "good versus evil" scenario was nearly grounds for treason. In that false dichotomy, if people did not accept that America was attacked because its assailants simply hate goodness and virtue, then they were traitors to the United States. There is thereby no room to try understanding what happened, what motivated those suicidal terrorists, comprehend how America's actions contributed to the situation, and so forth. It was [black/white thinking at its most dangerous](#).

Another fallacy of reasoning is related to the false dichotomy, and has been used to misrepresent my work. I questioned Mr. Skeptic's judgment in classifying an activist group trying to prevent [Mumia Abu Jamal's](#) execution as a "hate group." It is an Orwellism to call people trying to prevent (state-sanctioned) murder a "hate group." Orwellisms turn the meanings of words upside down. The group that Mr. Skeptic called a "hate group" was aggressive in their stance, but so were the WTO ([World Trade Organization](#)) protestors in Seattle, getting pepper spray in their eyes, plastic bullets in their faces, being kicked and receiving other violent treatment for laying in the streets. That does not mean that the protestors were violent or hateful. In

most cases, it meant exactly the opposite. Was Gandhi "hateful," with his civil disobedience? Was Martin Luther King, Jr.?

Even if Mumia Abu Jamal was indeed guilty of the cold-blooded murder of a policeman, America is about the only "civilized" nation with a death penalty. The rest of the "civilized" world does not agree with executing Abu Jamal, even if he were fully guilty. America is also nearly the only nation on earth that executes people for crimes they committed as children.^[2] In addition, there are major doubts about Abu Jamal's guilt, because kangaroo court has been a regular and well-documented feature of Philadelphia's judicial system, and those irregularities are glaringly evident in how Abu Jamal's trial was handled. For just one fact among many that makes the "cold-blooded murder" conclusion untenable, the dead policeman was in the process of administering a beating to Abu Jamal's brother when he was killed. The policeman may have thought that he was beating Abu Jamal, as the police had openly threatened him, and the mayor (and ex-police chief) had publicly called for silencing him and his uncomfortable questions and observations. During the summer of 2001, the courts denied the testimony of Arnold Beverly, who admitted that he shot the policeman that Abu Jamal was convicted of killing. Immediately after denying that confession of murder, the courts soon ruled that Abu Jamal should not be on death row. That ruling probably has everything to do with the protest efforts over many years, including Mr. Skeptic's "hate group." To millions of people, the proposed execution of Abu Jamal had far more to do with silencing a critic of the powerful than it did any sense of justice.

To some critics, questioning Mr. Skeptic's judgment became a defense of the organizations that Abu Jamal was active with, including the Black Panthers and M.O.V.E. Questioning the judgment of calling a protest group a "hate group" has nothing to do with supporting the groups *affiliated* with a person the "hate group" is trying to save. If somebody protested the kangaroo court conviction and execution of the Rosenbergs in the 1950s, does that make them a Bolshevik Communist? Such mischaracterization is also known as the *straw man* logical fallacy, which is where somebody misrepresents another's position, and then attacks the "straw man" they created. The attack on the *straw man* is supposed to substitute for attacking the real thing, trying to fool observers.

That tactic has been used repeatedly against my work and others'. [Chomsky](#) and [Edward Herman](#) wrote two books together more than twenty years ago, titled *The Political Economy of Human Rights* (originally titled *Counter-Revolutionary Violence*). The Warner Communications conglomerate suppressed the work's publication.^[3] Its academic book subsidiary, Warner Modular Publications, Inc., was printing ten thousand copies of the book when the president of Warner Modular's parent company (Warner Publishing) saw their ad for the book. Warner Publishing's president, William Sarnoff, whose uncle used to run RCA, then initiated the suppression. Sarnoff had the books destroyed, and even destroyed the catalog that listed the book. He summoned the Warner Modular president to his office, then verbally attacked him in such a way that the Warner Modular president and his staff resigned. Warner Modular was soon sold and then went out of business. Sarnoff destroyed his own company to prevent a book's publication. Did the Nazi book burners ever go that far?

[South End Press](#), located in Boston, eventually published the work. The *Boston Globe* has had a long-standing policy of never publishing a review of any book published by South End Press, one of the world's leading progressive publishing houses. The American establishment does its best to make sure that Herman and Chomsky's work never makes its way into mainstream awareness, as it does for any critic of America's political-economic system. In *The Political Economy of Human Rights: Volume II*, the authors deal with the treatment of America's devastation of Southeast Asia. The book's largest section deals with the American establishment's treatment of the disaster that befell Cambodia.^[4] The book's focus was not the nature of Cambodian atrocities against their own people, but how the American press and academics dealt with them, including how America contributed to it. They could not be more explicit in what their work attempted. In their words,

"As in the other cases discussed, our primary concern here is not to establish the facts with regard to

postwar Indochina, but rather to investigate their refraction through the prism of Western ideology, a very different task."[\[5\]](#)

Poetically, the book's suppression is a case study that illustrates the book's thesis. In their work, the authors tellingly expose the establishment's blatant double standards of reporting, where ideology (e.g., we are the good guys, and our enemies and victims are the bad guys) takes precedence over reporting the facts, and extremely so.

The American media establishment's propaganda stated that if the North Vietnamese "won" the war, Vietnam would be the site of a communist-instigated bloodbath, but one never happened. A peripheral nation to the Vietnam War, Cambodia was treated to a devastating bombing by America over several years, killing nearly 10% of the Cambodian population, with another 10% predicted to die in the bombing's aftermath. What America did to Cambodia was one of the 20th century's greatest acts of genocide. Although the American media did not predict what happened in Cambodia, the Khmer Rouge eventually became the violent nationalistic overlords that the media predicted would rule Vietnam.[\[6\]](#)

The purpose of *The Political Economy of Human Rights: Volume II* was to analyze how the American propaganda machine dealt with the facts regarding Southeast Asia, *not to debate the facts*. The American media focused the *false dichotomy*, *straw man* and *ad hominem* logical fallacies toward its critics during those years. Anybody critical of the media's handling of the events surrounding Cambodia became supporters of the Khmer Rouge; calling attention to media hypocrisy was dishonestly transformed into supporting the actions of the propaganda targets. While it was concocting a propaganda story, *Time* magazine tried baiting Chomsky into voicing his support for the Khmer Rouge regime.[\[7\]](#) Instead of a nod of approval for the Khmer Rouge, Chomsky gave *Time* a list of American media fabrications regarding the situation.[\[8\]](#) Unable to lure a statement of support for the Khmer Rouge from Chomsky or anybody else, *Time* resorted to reporting that anonymous "political theorists" defend the "[Cambodian tragedy](#)."

Chomsky and Herman took great pains to differentiate criticism of America's propaganda system from supporting the actions of people such as the Khmer Rouge. On page 256 of their book, they *could not* have been more explicit:

"It is a common error, as we have pointed out several times, to interpret opposition to U.S. intervention and aggression as support for the programs of its victims, a useful device for state propagandists but one that often has no basis in fact."

The authors are being charitable in describing such an interpretation as an "error." They thoroughly dealt with how the media tries making that bogus connection with its critics, and *Time* even unsuccessfully tried baiting Chomsky into that trap. Chomsky and Herman could not have been more explicit in their position, yet ever since the publication of *The Political Economy of Human Rights*, many of Chomsky's detractors have made the claim that he was defending or denying the crimes of the Khmer Rouge in that work. To this day, people ask Chomsky "tough questions" about his active support for the Khmer Rouge. To Chomsky, it must feel like being asked the Russian classic, "Have you stopped beating your wife?"

Even worse, the so-called "left" has contributed to that misrepresentation of Chomsky's work (while somehow Herman largely escaped criticism).[\[9\]](#) I received an email from one of my critics that he ignored Chomsky's work (whose work I use significantly in my own) ever since he read Chomsky "defending the Khmer Rouge" atrocities.

That critic either:

1. Did not read Chomsky's work;
2. Did not comprehend it;
3. Or he is being dishonest.

The answer is probably option 1, which also makes option 3 true. He likely read one of the many attacks on Chomsky that fraudulently misrepresent his work, using the *straw man* fallacy.

Conspiracy Theories, the “Company I Keep,” Presentism and Dennis Lee

[Dennis Lee's critic Mr. Skeptic](#) practiced the logical fallacy termed *appeal to inappropriate authority* when he [cited a newspaper article about Dennis' "criminal" record](#), when Dennis himself reproduced the official documents on his "crimes," which demonstrate that the newspaper articles were lying, and Mr. Skeptic knew it. In Mr. Skeptic's case, it was a case of dishonesty as well as poor logic. Another of Dennis' critics followed Mr. Skeptic's lead (and publicly thanked Mr. Skeptic for his help) when he reproduced newspaper clippings on Dennis' "criminal" record, and he eventually retracted his libel after I repeatedly informed him of it.

On various occasions, I have received this observation: my work is a conspiracy theory. One critic called my [essay on the cancer racket](#) an unbelievable conspiracy theory, because the conspiring doctors would not send themselves to their deaths by using orthodox treatments that do not work. I doubt that he read one word of my essay before launching his "conspiracy theory" criticism. Reading that essay will eliminate the notion that it is a conspiracy theory. It is nearly the opposite. There are almost surely wide-ranging conspiracies in the [medical racket](#), as there are in the [energy racket](#). While I will not deny that conspiratorial activities happen during the pursuit and maintenance of wealth and power, the primary thrust of all my work is that we *all* have a hand in what happens in our world, and what the left calls "structural analysis" (or "institutional analysis") explains more of the dynamic than conspiracies do. I have been called a "[conspiracy theorist](#)" for mentioning the [billion-dollar bribe](#) we were offered to stop pursuing free energy. The state of affairs in the energy and medical industries are a few percent conspiratorial, at best, and more than 95% "unconscious," largely because people refuse to accept responsibility for what is happening. That was the [main lesson of my journey](#). We *all* bear responsibility for what happens in our world, which also means that we can *do* something about it, which should be good news, I would think.

For those who prefer playing the victim game, however, such news is the worst imaginable, which is why those who play the victim game have been my harshest critics. A paradox accompanied that realization. My harshest and most irrational critics are almost exclusively educated white men, who are history's biggest "winners." Few would readily identify educated white men as victims, but victims and victimizers operate from the same dynamic: both feel powerless inside. When people attain self-mastery and self-love, they do not feel the need to exploit others to attain life's goals, live the "good life," etc. Those who feel that they *are* victims react by seeking situations to become victims, or seek situations where they can victimize others. They want to be winners, which they interpret to mean that there must be losers.

Whatever anybody does to another, they ultimately do to themselves. Jesus spoke about reaping what we sow, and Eastern religions have their concepts of reincarnation and karma. That concept bridges the paradox of why victims and victimizers play the same game. In the end, victimizers are their own greatest victims. It just takes awhile for what goes around to come around. As people endlessly victimize one another, thinking that that is what it takes to be winners, humanity may reap the bitter harvest where *everybody* loses, as we destroy our planet. We can all be winners. There do not have to be any losers. With love, [we can have it all](#).

This web site's largest essay is its [American Empire](#) essay. It grew from my writings about Iraq, and does

more than tell the story of America's latest exercise in genocide, but what it has been like to be an American during those events. Iraq is *our* genocide, one that America is nearly entirely responsible for. Iraq is not the site of America's first oil-control genocide, and it may not be the last.

One site that published my original Iraq essays was Radio Islam, a decidedly anti-Jewish site that has published the work of many scholars such as Noam Chomsky and Edward Said.[\[10\]](#) Nobody can honestly say that [my work is anti-Jewish](#). Nevertheless, on more than one occasion, because Radio Islam has published some of my work (which barely mentions Israel or Jews), I have been called an anti-Semite. The critics who assailed my integrity because Radio Islam published some of my work *never* addressed my actual writings. They *never* made one substantive response to my work, but called me an anti-Semite.

Well-meaning people have repeatedly informed me that my work will be continually assailed because Radio Islam has published some of it. If past experience is any guide to the future, the critics who do so will *never* address my writings in anything resembling a reasoned critique. Some criticisms will be patently dishonest, while the rest will be filled with the logical fallacies that are presented here. If critics want to assail my work, that is their right, but a critique of my work has little to do with who published it, and this site is my primary publishing conduit. If I cited Radio Islam as a publishing source to try making my work seem more credible, or if I endorsed Radio Islam's site, my critics' comments may hold water. Anyone who wants to can link to my site or reproduce the writings on it.

[My Jewish writings](#) firmly rebut most of the anti-Jewish writings on Radio Islam's site, and it is to Ahmed's credit that he publishes the work of somebody whose work counters his own. Ahmed may remove my work from his site one day (he will not correspond with me anymore), and it would give some of my critics less ammunition, but those critics have never addressed my work.

My critics have told me that allowing Radio Islam to publish my work has allowed them to judge me by the company I keep. For an example of truly keeping somebody's company, I have kept company with [Dennis Lee](#). Dennis is a literalist Christian. I am not a Christian, much less a Bible-banging one. Does "keeping company" with Dennis taint me? Does Dennis' keeping company with me taint *him* in the eyes of his fellow Christians? If I stopped associating with right-wingers, homophobes and fundamentalist Christians, my circle of friends and associates would be far smaller than it is. America is filled with those kinds of people. What would I accomplish by refusing to associate with them? I truly have "kept company" with Dennis, and one of the greatest honors of my life is having been involved with him. I have never met Ahmed. If the KKK publishes my work, or links to it, am I "keeping company" with them? If I am, does that mean that I endorse their views?

Throughout the years, people whose interest in my work was kindled by my relationship to Dennis Lee have often called me "Dennis' most loyal supporter" and similar phrases. [Mr. Professor](#) was a more loyal supporter of Dennis than I was. My loyalty has always been to making free energy happen, and although my respect for Dennis is beyond words, the "most loyal supporter" label tagged to me is often done by people who then portray Dennis' organization as a cult or with criminal intent, so calling me Dennis' "most loyal supporter" casts me as a cult member who hero-worships Dennis (something I have never done), or a criminal accomplice, or some other tactic to try dismissing my work. This site is obviously not about Dennis all that much, or even free energy.

Another charge leveled against my work is that it indulges in [presentism](#). Presentism is judging the past by the standards of the present, but what my work demonstrates is how the history I was taught [is a pack of lies](#), although more the lies of omission than commission, as with all good propaganda. That is a distinctly different issue from presentism. In a sense, the presentism argument has been a method of attacking people who bring up the truth of the [Columbus Myth](#) and other [lies Americans have been taught as "history."](#)

Presentism would be judging Columbus a filthy man, when all fifteenth century Spaniards reveled in their filthiness. To say that fifteenth century Spaniards were a filthy people is not practicing presentism, for they were. They were much filthier than the Moors or Native Americans of the day, for instance, who [bathed regularly](#).

To say that Columbus engaged in mass murder is not engaging in presentism, because he did. Mass murder was a regular practice of the Spaniards of the day, so although Columbus was a mass murderer, he was not a "bad man," relative to his fellow Spaniards. Similarly, Columbus was dishonest, [stealing](#) the reward for first sighting land on the first voyage. Thievery is thievery, five hundred years ago or today. Similarly, [kidnapping the natives](#), which Columbus did on the very day he "discovered" the New World, may have been a standard practice of the [Portuguese slave runners](#) (Columbus was a slave runner), but those he kidnapped [almost all died](#) within a few months of capture. Kidnapping them definitely violated them.

If somebody states that Columbus was a relatively [typical Spaniard](#) of the day, that is fine, and I say the same. However, kidnapping, the mass murder of innocent people, theft and the like were as horrible then as now, even if Columbus invoked God as he did it, especially for those who suffered at his hands. The Conquistadors' practice of [feeding live native infants to their dogs](#) shocked even the priests of the day. When would the practice of feeding live infants to dogs be in keeping with the mores of the day?

Columbus initiated the first and only [complete genocide](#) of *millions* of people. He led the effort, and one of his early programs was chopping off native hands that did not give him enough gold. He was brutal, self-pitying, greedy, dishonest, cruel and a hypocrite. He also had some virtues, such as persistence, courage, and even some sense of honor, though it was sporadically evident. Even [Hernando de Soto](#), Stalin and Hitler had a sense of honor, however infrequently it was evident. Yet somehow, Columbus was transformed into a national hero, with an American national holiday in his name. A greedy mass murderer was turned into a national hero, and the American history profession participated in whitewashing his image. If we have a [Columbus Day](#), then the Germans could have a Hitler Day and we would have no room to criticize them. Columbus was no [monster](#), not for his day and place, but there is little evidence that justifies making him a hero, and far more that justifies monster status.

Ironically, the heroification of Columbus was a major act of presentism by [American historians](#) and others. Columbus was posthumously transformed into a hero when it came time to justify and [glorify what Europeans did to the New World](#), and it reached new levels in the United States. One meaning of presentism is that history can be important to the present, to help us understand today better. In that regard I am a presentist, guilty as charged.

Critics have blamed me for making white people into monsters. White people are history's most murderous people due to several factors, and being Christians may be one of the most important, as the Judeo-Christian ethic [actively justified the violence](#) that Europeans inflicted on the world. The primary reason Europe prevailed (and still does today - the U.S. population is mainly composed of the descendants of invading Europeans) was their mastery of violence. To the Native Americans in Columbus' day, for instance, the invaders were *all* white, European, Christian, and (not coincidentally) men.

The American history profession, as with probably every profession, [has prostituted itself](#) to the prevailing winds of wealth and power, and has served up all manner of criminals and murderers as heroes and saints. I am a white man. I was taught white history. My adult investigations have shown me that most of what I was taught about my noble forefathers was fanciful at best, which crippled my sense of reality, and I am still recovering from it. A Chinese woman could probably study the history she was taught, and discover that she was also taught lies. However, my work is about what *I* was taught, not what *she* was taught. Some critics have *assumed* that my work is supposed to be a multicultural synthesis of what the world is today, or was. I cannot speak for the people of India today, or the extinct Taino, or arrive at a sophisticated cultural assessment of today's world. I fully admit that limitation. My work is in large part *my* story. I can *do something* about the lies being told *in the society I live in*. The Chinese people will need to correct their own self-serving myths.

Threadbare Rhetorical Devices

George Orwell wrote in his *Politics and the English Language*, “In our time, political speech and writing are largely the defense of the indefensible.”[\[11\]](#) If anything, it has become worse since his time. [Orwell’s 1984 was also eerily prescient](#). Orwell simply saw where trends in his time were headed. In his censored preface to [Animal Farm](#), Orwell wrote,

“...it is the liberals who fear liberty and the intellectuals who want to do dirt on the intellect...”

The “defense of the indefensible” has always had the same goal: denying responsibility for what happens in the world, fingering “bad guys,” and justifying violence and exploitation by the powerful, who the defenders of the indefensible either work for, or they benefit from the indefensible actions. Establishment rhetoric is obsessed with finger pointing and [rationalizing the victim game](#), and regularly violates the most elementary rules of logic. The following section is a brief guide on the kinds of logically flawed argumentation that parades across the pages and airwaves of America’s media, and in academic and corporate realms, with pundits holding forth in ways that would have made Orwell cringe.

Those irrational arguments are not difficult to see through, once an eye for them is developed. If people become aware of how false it is, it can no longer influence their thinking, and can also be pointed it out to others, although often at great personal risk. Few want to hear about that tattoo on the emperor’s backside, especially when it sits in plain view.

Chomsky says it is a simple ethical principle: we are most responsible for the predictable consequences of *our* actions.[\[12\]](#) That principle is abandoned while defending the indefensible. One need not [wax mystical](#) to understand the often-subtle ways that *we all* [create the world we live in](#).

America’s [War on Terror](#) during 2001 and afterward, a [war that Rumsfeld says may take generations](#), is not new. It was Ronald Reagan’s theme when he took office. The irony of Reagan’s “War on Terror” was that the United States government was easily the world’s greatest terrorist organization during [Reagan’s reign](#), but establishment pundits [simply defined state terror out of existence](#). Reality is inverted largely by framing it with useful assumptions. If state terrorism is defined out of existence, then states can never commit terrorist acts, as a tautology. That *assumption*, if hewed to, will guarantee that state terrorism [is never even acknowledged](#), much less analyzed. That is how [blinding paradigms](#) are created.

[Edward Herman](#)’s *The Real Terror Network* was published in 1982, early in Reagan’s reign of terror. Herman followed it up about a decade later with *The Terrorism Industry*. Herman is one of the world’s most astute voices regarding terrorism, although his face was never seen in the mainstream media during the aftermath of the World Trade Center (WTC) attacks. In [The Real Terror Network](#), Herman presented the assumptions that underlay the double standard of never calling state terrorism what it is, while the old ladies of [Women in Black](#), who have never hurt anybody and are some of the West’s most courageous people, were dubbed “terrorists” by the FBI in 2001, even after they were nominated for a Nobel Peace Prize. Below are principles that must be followed so establishment apologists can write about terrorism with a straight face:

The principle of averting the eyes from National Security State (NSS) terror; Herman’s book was written before the [reign of terror in El Salvador](#) peaked, but the performance of [Elliott Abrams](#) on the issue was an example of how that principle worked; this is also an example of [decreasing the negative cognitions](#);

The principle of reliance on government as the source of the relevant and the true; that principle also

became part of the [third news filter](#) in Herman and Chomsky's *Manufacturing Consent*;

Stripping away of context; facts are stripped from their sources so the big picture is obscured; the media consumer thus becomes like the blind men and the elephant; one day the consumer reads about a tail, about a tusk the next day, and a trunk the next, but is never told that they all seem part of an elephant; that principle is similar to the reductionism often seen in [Western science](#), where everything is boiled down to its lowest-common-denominator, so the big picture is invisible;

The principle of balance; it is the pretense that state terror is equivalent to "left" violence, or that the government is trying to be a mediating influence between leftist and rightist terrorists; the Uruguayan military continuing to commit massive violence long after its leftists had been exterminated was an uncomfortable fact not considered by those who saw government actions as "balancing" between the extremes;

The principle that the NSS is led by moderates standing between the poles of extremists; it is related to the prior principle of balance, and in order for the fiction to survive even minimal scrutiny, the "right" violence had to appear independent of the government, something that State Department front man [Elliott Abrams](#) was adept at managing;

With the NSS let us look at the bright side; with that principle, the state's awesome crimes are swept under the carpet, and photo ops and other staged events are emphasized, or journalists who interview U.S.-controlled butcher dictators stress their humanity; those same principles are how [Columbus](#) was transformed into a national hero, how [Washington](#) became "the father of the country;" that is also an example of [increasing the positive cognitions](#);

With the NSS the relevant world is that seen by the elites; that is a common tactic where the peasants who die by the hundred thousand at the dictator's hands are never asked how their lives are going, but instead the only voices heard from [Indonesia](#), for instance, are those of the generals ordering the genocides, their sycophants, or the genocide's beneficiaries;

The United States is a disinterested party; as Herman wrote, that principle is "applied only when convenient;" in numerous U.S.-orchestrated, financed and armed coups and slaughters, the U.S. media completely hid the U.S.' hand, as if what happened in [Chile](#), for instance, was simply a domestic situation, free from outside intervention; however, the facts coming into the light during the past generation clearly demonstrate that Pinochet was virtually a U.S. puppet, and the overthrow and murder of Allende was orchestrated from the White House;

The U.S. natural right to intervene; that principle is starkly evident today, as there is barely any discernable dissent in America's mainstream media over the [open discussion taking place regarding overthrowing Saddam Hussein](#), as if it is not only America's right, but a duty;

Communist Terror as the Pot of Gold at the End of the Rainbow; with the collapse of the Soviet Union, this principle is dated, but its essence became the [worthy-unworthy victim](#) concept in *Manufacturing Consent*, where victims of communist terrorism received more than one hundred times the media coverage of victims of U.S. terrorism.^[13] Herman has recently written about how that principle has played out in the [aftermath of conquering Afghanistan](#).

Those factors helped make state terror invisible in the American media (at least Western state terror, especially U.S.-inflicted), and highly inflated the terror by the powerless, even fabricating it. I have never seen anybody make a credible rebuttal of Herman's work, and I have looked. However, perusing book reviews from the public at Amazon.com and reading all the one-star reviews that the work of Chomsky, Herman, Parenti and other dissident scholars garner provides good examples of the kinds of rhetorical devices that are discussed below.

See the world as made of heroes and bad guys. That is the comic book view of the world, one that George Bush the Second made explicit when he said the War on Terror was a case of “good against evil,” and then he told the world that everybody was either “with us or against us,” making it clear that “evil” meant anybody who failed to support the [War on Terror](#). [That the “bad guys” were “good guys” when they did our bidding](#) makes that argument ludicrous.

Focus on the unintended beneficiaries of our crimes, even vastly exaggerating their benefit, as if helping them was our sole motivation, while ignoring or demonizing those who suffered from our actions. That tactic was especially evident during the 2001 attack on Afghanistan. While the U.S. unilaterally attacked Afghanistan, putting millions of people in immediate risk, the U.S. media downplayed the [humanitarian disaster that loomed](#). The civilian death toll from the U.S. bombardment was barely even reported in the U.S. media, a [death toll that exceeded the WTC attacks](#), and the media instead had photo ops of Afghanis welcoming the Taliban’s opposition, the Northern Alliance (NA), who were the same warlords and their bloodthirsty rabble whose reign in the 1990s helped bring the Taliban to power. Suddenly, the bombing of Afghanistan was freeing its oppressed women. Afghani women are barely any better off than they were under Taliban rule. The Revolutionary Association of the Women of Afghanistan (RAWA) issued a statement as the U.S. bombs and warlords defeated the Taliban. In part it stated:

“The retreat of the terrorist Taliban from Kabul is a positive development, but entering of the rapist and looter NA in the city is nothing but dreadful and shocking news for about 2 million residents of Kabul whose wounds of the years 1992-96 have not healed yet.

“Thousands of people who fled Kabul during the past two months were saying that they feared coming to power of the NA in Kabul much more than being scared by the US bombing.”[\[14\]](#)

RAWA issued a statement on International Women’s Day, March 8, 2002, which discussed the post-Taliban situation in Afghanistan and the women’s lot. It stated in part,

“The existence of one or two showpiece women in the transitional administration (one belonging to a party infamous for being a lackey of the Iranian regime and the other a former high-ranking member of a party which epitomizes treachery to the motherland) is more an insult to Afghan women than a symbol of the restoration of their status and legal rights. The women of Afghanistan have not been liberated. This fact has been most succinctly summed up by the *New York Times* in its issue of November 19, 2001, when writing about an Afghan widow with eight children to feed: “Now, at least she is free to beg”!

RAWA gave America a little too much credit however, by stating:

“It is the conscience of the people of the United States that is scourged first and foremost by the slaughter of innocent Afghans in consequence of US bombardment in Afghanistan. Proof of this is amply shown in demonstrations against the war in Afghanistan in most American cities.”

I was in a peace march of a couple thousand people in Seattle, immediately after the WTC attacks. The local media barely covered us. American protestors of America's bombing of Afghanistan were far less than one percent of the U.S. population. Yes, we made some noise, but it was a whisper compared to the media's propaganda barrage. [Acts of flag-waving](#) during the bombardment outnumbered protests by at least 100-to-1. Fortunately, the Seattle marchers were not subjected to what peace marchers experienced on America's East Coast and heartland. I have only [marched behind priests and nuns](#), marching alongside post-menopausal women, as they *usually* do not get their heads busted by cops and counter-protestors.

Similarly, when [Iraq was bombed back into the Stone Age](#), the media played up the freedom Kuwaitis would soon enjoy. In reality, the [Kuwaiti government came back into power wielding a steel fist](#), and the Kuwaiti people did not exactly experience a golden age after the Gulf War, and the media was silent about political freedom in neighboring Saudi Arabia, [which has one of earth's most oppressive regimes](#). Whatever freedoms the Kuwaiti people may have enjoyed after the Gulf War, the war was obviously not about giving them their freedom. That rhetorical device is always used to cover up the intervening party's motivation. The United States has *never* intervened to help the peoples of the lands it invades and bombs. There is no such thing as [humanitarian intervention](#), and there [never has been](#). It can be a useful fiction, however.

Point to flaws in our victims to justify their treatment at our hands. This is one of the oldest tricks in the book, and highly unethical. Julius Caesar remarked on the barbarity of the Celtic people after his first failed invasion of the British Isles. The observation was partly intended to justify conquering them, to bring them "civilization." When [Spaniards overran the New World](#), in [history's greatest genocide](#), they constantly played up cannibalism and human sacrifice, even though the cannibalism reportage was a myth [from the every beginning](#), and human sacrifice was [greatly exaggerated by the Spaniards in South America](#), and elsewhere. American propagandists demonized "communists" for many years, as a way to justify killing them en masse, something that [Ralph McGehee](#) and many others eventually discovered was a fabrication. However "bad" somebody might be does not confer any integrity to those who bludgeon them to steal their land and lives. During the [long dispossession of North America's natives](#), the European invaders nearly always concocted rhetoric to make the natives seem subhuman, to justify their extermination and dispossession.

Accepting of one's responsibility for their participation in dark deeds becomes "self-hating" behavior, or an "attack" on one's group. That is another [false dichotomy](#), and has been directed countless times toward Americans who try to halt U.S. international aggression, partly because it is happening in their name. In the rhetoric of establishment apologists, we either have no responsibility at all for our behaviors, or we are self-hating. Chomsky becomes a "self-hating" Jew when he takes the [Israeli state](#) to task, especially when he also shows U.S. complicity in Israel's great crimes against the Palestinian people. The U.S.' mass response to [dropping nuclear bombs on Japan](#) is another example of that phenomenon at work. Being in denial or being "self-hating" is a transparently unethical false dichotomy. People who refuse to accept their contribution to, and responsibility for, various problems *cannot* arrive at constructive solutions to them. *Nobody* can solve another's problems. Until we own it, we cannot change it for the better.

Deny, deny, deny the obvious, and when it becomes so overwhelmingly obvious that it can no longer be denied, either claim to have discovered it, or claim it is so obvious as to be trivial, so trivial as to be beneath discussion. That one has played numerous times in long-running discussions that people have had with me, and it plays out in several variations in public controversies. It is related to [Orwell's doublethink](#). The original adversaries of the idea claiming that they discovered it themselves may seem too fantastic to believe, but it is a well-known phenomenon, remarked upon by [William James long ago](#), when talking about how orthodoxy initially reacts to theories it eventually embraces. When I first read James' quote in 1990, I thought he took his rhetoric a little too far in making his point, but I began seeing [exactly that phenomenon happen](#), and it may happen again soon in [orthodox medicine](#). Edward Herman calls it chutzpah, an American specialty.^[15] People have challenged me on the [thesis of Herman and Chomsky](#) about how the media works, or how [orthodox medicine works](#), or how the [energy racket](#) works, and for years they would call

me wrong. Finally, as it began to sink in, they gradually understood what I was saying, even finally seeing for themselves examples of it in action, dynamics that were previously invisible to them. Then one day, without even an acknowledgment that their new understanding had anything to do with me, they then begin preaching *to me* about how the energy racket works, as if I had no idea. On denying the obvious for a long time, then trivializing and dismissing it the very first time they acknowledge it, is a cousin to [Elisabeth Kübler Ross' work on death and dying](#), where people facing the inevitable move from denial to acceptance, after a long, fitful process. Transcendence *can* follow acceptance, as part of the enlightenment process. What people have done in the trivializing process is play the denial game as long as humanly possible, and then when it is no longer possible to deny, then trivialize it, acting as if they had already achieved transcendence. That not only uses flawed logic; it can be a dishonest practice, engaged in consciously.

Wage *ad hominem* and straw man attacks, and purvey obfuscating irrelevancies that pose as critique.

That nearly sums up the tactics of those who give one-star reviews of Herman and Chomsky's work at Amazon.com. One review I saw of Parenti's [To Kill a Nation](#) will serve to illustrate part of that dynamic. The purpose of Parenti's book was to *show* [what the U.S. did to Yugoslavia](#), and *why*. His book was not about which Yugoslavians acted honorably or not, but what the United States did there (although he also showed that the [U.S. supported the fascists](#) there, as usual). Parenti takes the high ethical ground of taking the motivation of *his nation* to task. One review by a right wing scholar completely ignored the main thrust of Parenti's work, to instead write about how Parenti's understanding of Yugoslavia was not as good as other scholars regarding Yugoslavia. The right wing scholar tried framing the issue as who was the bad guy in Yugoslavia, demonstrating that he unthinkingly accepted the [U.S.' right to intervention](#), which the purpose of Parenti's book was to challenge. Parenti wrote an apple book, and the right wing scholar took him to task because it was not an orange book. Such efforts are pseudo-critiques, and also use the [straw man fallacy](#), if even honestly done. The right wing scholar also used big words and cited irrelevant authors, which supposedly showed how sophisticated and well read he was. Such pseudo-critiques never engage in substantive analyses or direct challenges to the author's work, but instead attack the author's style, accuse the author of getting his/her facts wrong (but never point out where he/she has), often use big words and refer to other authors, saying the work they are critiquing is derivative or a poor attempt at copying the named author, but present no examples of that "fact," and so on.

Those kinds of rhetorical devices are increasingly threadbare, although they never seem to go away.^[16] One is shown for what it is, and another takes its place. It has everything to do with integrity and being responsible for one's actions. When people begin accepting their responsibility for how the world is (acting like creators instead of victims), and begin trying to change it, those kinds of arguments will disappear, or at least not be how America's media, major institutions and establishment defenders ply their trade. In early 2006, I finally realized that the apparent lack of rationality and ethics I was seeing [might be something else](#).

Footnotes

[1] Similarly, the Gore/Bush "choice" in the 2000 presidential election is another example of a false dichotomy, where voters for [Ralph Nader](#) were told that a vote for Nader was a vote for Bush. One could not vote for what Nader stood for and be against *both* [Bush and Gore's positions](#), in that logical fallacy. The Gore crowd relentlessly attacked the Nader voters because they said that even if Gore was less than ideal, Bush was worse. It was the lesser evil argument. When people choose the lesser evil, they still get evil. The "lesser evil" argument is known also as *realpolitik*, where power takes precedence over ideals, because it is supposedly "realistic." Machiavelli was one of the fathers of political "realism."

[2] America was the only nation in the United Nations that abstained from voting on holding the [Convention on the Rights of the Child](#) (the vote was 150-0-1). America also has the world's only standing government that refused to ratify the treaty that the convention created. One of the convention's resolutions was to ban the death penalty for children.

[10] In December of 1998, America began bombing Iraq again, a bombing that continues to this day. The evening the December bombings began, I was literally sick over what we were doing to Iraq. Instead of writing another letter to the editor, that night I wrote an essay titled "In the Service of Empire." The next day I sent it to dozens of web sites, putting "Iraq" into an Internet search engine and firing off my essay to all the sites it hit. Both the political right and left published it. Hank Roth (a.k.a. The Golem) published part of it with other leftist essays the next day, and my work appeared around the Internet. One especially enthusiastic person was Ahmed Rami, who runs the Radio Islam web site. He posted it to his web site and offered to host on his site whatever I wanted to write. His offer spurred me into writing my web site. Ralph McGehee published my [synopsis of his Deadly Deceits](#) across the Internet; the [Leading Edge International Research Journal](#) published the first draft of my fluoridation essay, and had it on their web site. One of my readers reproduced my entire 600-page web site from 1996; Hank Roth published some of my letters to the editor, and my work was appearing across the Internet. Although I will allow anybody to publish my work (as long as they do not reproduce excerpts that misrepresent it), I decided that it would be best if I had one roof under which to house my work. This web site is that roof. I have to thank Ahmed for spurring me into creating this web site.

If the Ku Klux Klan or General Motors wanted to publish my work on the Internet, I would let them. That would not mean that I was endorsing their views, but it might mean that they were endorsing *mine*. The light can glimmer into the darkest caves. I would actually *like* to see my work grace neonazi web sites or corporate America's, as it may be able to reach people and soften their views. We are all in this together. The Radio Islam site is not filled with what I would call superb scholarship. In fact, it reproduces some of the most notorious anti-Semitic writings in history. It also reproduces the work of Chomsky and other scholars who are critical of Israel. I have used the Radio Islam site as a source of information. The only place I could find Henry Ford's *International Jew* writings (Hitler praised Ford's anti-Semitic crusade in *Mein Kampf*, and later called Ford one of his most important influences) was on Radio Islam's site. The problem with Radio Islam's site, though, is that writings such as *The Protocols of Zion* and *The International Jew* have credibility with Ahmed. His work is decidedly anti-Semitic. Ahmed lives in Sweden and spent time in jail for publishing his work. Even Sweden does not have that much freedom of speech. I did not know the nature of Ahmed's site when I emailed him my work on Iraq, but I certainly do not regret that I did so. I will not be contacting too many right wing sites when my site is finished, partly because it will be a waste of my time, as I doubt they will like what I have to say. Yet, if they want to publish my work, I will happily let them. The left wing will not like everything that I have to write about either. I doubt that *any* reader will totally agree with my work, as much of it is "out there," and I do not avoid controversial topics.

[14] Statement of RAWA, November 15, 2001.

[15] See Herman's *Beyond Hypocrisy*, which is a hilarious/horrifying look at American establishment hypocrisy, so extreme that it goes beyond hypocrisy, and Herman had to find a new word to describe it, and he hit on chutzpah, and has given the Chutzpah Award to the most egregious cases of media hypocrisy. In his Doublespeak Dictionary in *Beyond Hypocrisy*, Herman defines the "chutzpah factor" thusly:

"Self-righteousness, arrogance, and a sense of superiority so great that gross double standards seem entirely reasonable and no self-interested action is beyond rationalization. This factor is positively correlated with size, power, and per capita income."

[16] A good book on the inability of Rush Limbaugh to make coherent and logically consistent arguments is Ray Perkins, Jr. *Logic and Mr. Limbaugh*.

Making a Run at Alternative and Free Energy

By Wade Frazier

[Introduction](#)

[A New Kind of Technology](#)

[The Early Adventures of Dennis Lee](#)

[Dennis Makes a Run at It](#)

[The Pursuit of Free Energy](#)

[Footnotes](#)

Introduction

This essay is ancillary to this site's [main energy essay](#), and will chronicle what may be the most sustained effort ever made to bring alternative energy to the American marketplace. I also participated in it, and make a number of personal observations in the following narrative. Also, the man who led the effort has been slandered, libeled or ignored ever since, and the record needs to set the straight, for not only posterity's sake, but if humanity is to avoid its self-extinction, people need to understand how today's world works. The final chapter of Dennis Lee's adventures has yet to be written, because he is still at it, even after spending a couple of years behind bars for his trouble. Whatever the heroism or failings of Dennis may be, we are *all* responsible for how today's world works.

A New Kind of Technology

Since [electricity is four times as expensive as natural gas](#), few sane Americans would heat their homes with electricity, but it happens. My home today is heated with electric heaters, mainly because of all the hydroelectric projects in Washington State. I pay about \$100 per month for my household energy. When I lived in New Jersey, my apartment had electric heat, and I paid about \$200 per month for my household energy. Gas furnaces cost thousands of dollars, while electric heaters cost a small fraction of that. Electric lines run in places where gas lines are too difficult to install. Gas has its dangers, such as explosions and asphyxiation (reduced because artificial scent is added to natural gas, so leaks are easily detected in the home). Electricity has its hazards, such as electrocution and radiation from high voltage lines. Millions of homes have heat pumps. If a heat pump can average a COP of two, then it would be twice as efficient as using that electricity to run space heaters.

Why are *any* heat pumps sold in the United States, if electricity is four times as expensive as natural gas? If a heat pump averages a [COP](#) of two, then electricity is still twice as expensive as burning natural gas for heat. There are regional variations in electric and gas prices, which can make the relationship closer, however. In addition, there are variables in the economics of producing electricity. For instance, the electricity production infrastructure is geared toward meeting peak demand. Only 1% of the time does the nation's electric production system operate beyond 75% capacity, and it operates at about 25% capacity more than 10% of the time. Electric demand in the United States increases about 15% between winter and summer, and the hot, daytime, business hours are the peak times, when air conditioners are running. At night and in the winter, demand can slacken dramatically. There are technical and practical issues with turning on and off electric company steam turbines. Electric company turbines run all the time, but idle during off-peak hours. Electric companies have long encouraged businesses to use electricity at off peak hours, and do so with preferential pricing. For instance, today the Niagara Mohawk electric company charges more than 17 cents per kilowatt-hour (kWh) at peak times, and less than four cents per kWh on off peak. Also, if a home or business uses electricity for heating, electric companies can give preferential pricing. What if heat pumps could get COPs of eight? Then heat pumps could operate at half the operating cost of natural gas furnaces. Here is where Dennis Lee's heat pump comes into the picture.

A diagram of a standard air-to-air heat pump is presented below.

Click on image to enlarge

In 1974, during [America's first energy crisis](#), a Colorado cowboy bought a heat pump. Heat pumps are often used to both heat and cool homes. In the winter they pump heat into the home, and in the summer they pump heat out of the home for air conditioning. To work as an air conditioner in the summer, heat pumps needed be placed in the shade, often next to the house. Being in the shade helps for the summer, but hinders winter performance. The cowboy did not know how the heat pump worked, and called an engineer friend of his to come over and explain it. He showed that it was like a [refrigerator](#). The cowboy understood, and asked,

“What if I do not have a need for air conditioning, and only want to use it to heat my home? Then I would not want a heat pump sitting in the shade, but sitting in the sun. If I put that heat pump on the roof of my house, I bet it would operate more efficiently.”

They did just that. They also cut apart the evaporator array and laid it out flat, to get the full effect of the sun's rays. They hooked up some gauges, and before that heat pump virtually exploded, they obtained some amazing data. For producing heat, much higher efficiencies could be produced by sitting the heat pump in the sun. The cowboy told his buddy, “We'll be rich, putting heat pumps on people's roofs.” The engineer told him the heat pump could stay on the ground; only the evaporator needed to be on the roof. Their company was born that day on the cowboy's roof. It was named LamCo, a name based on the cowboy wife's initials.

The solar industry in America was already growing in response to the energy crisis, and an instance of serendipity happened. They only needed the evaporator on the roof, and they made the evaporator look like the day's solar panels - large, flat, black - and not the standard tube-and-fin heat pump evaporator. Below are evaporator arrays on LamCo-style units in the field.

Click on image to enlarge

Note the large, flat surface area. The LamCo-style evaporator, in an eight-panel array, provided about 400 square feet of surface area contact with the environment. The standard heat pump provided only a few square feet at best. LamCo stumbled onto a thermodynamic advantage.

The [Carnot ideal](#) has never been attained for good reason. With heat engines, entropy saps their efficiency. Hot always goes to cold. As the temperature of any substance rises, so does the motion of its molecules, and the hotter anything gets, the more disordered its molecules become. Boiling water is simply adding enough energy so that the motion of the molecules overcomes their attraction to each other, and water is liberated as steam. That greater disorder is known as entropy, and all heat engines face the entropy issue. The disorder of the molecules increases as they get hotter, and less as they become cooler. When steam condenses into liquid as it cools down, as in a steam turbine's condenser, the entropy is taken from the closed system, allowing the water to be used in the cycle again. The shape of the turbine blades, the efficiency of the tubing that links the components (straight and wide is better than curvy and narrow, so the molecules do less banging into each other and tubing walls, and more banging into the turbine blades), the heat losses between boiler and turbine, the friction in the turbine bearings and the like decrease the system's overall efficiency, so the Carnot ideal is never attained. The best steam turbines today only [reach about half the Carnot ideal](#). The standard heat pump, however, only reaches a paltry 10% of the Carnot ideal. With heat pumps, the components that affect the efficiency are the pump, evaporator, condenser and components that link them. Poorly designed or implemented tubing can affect efficiency, but the big variables are the two heat exchangers: the evaporator and condenser. With heat pumps, the Carnot ideal is approached as heat exchangers reach ideal efficiency, which in practice means as they tend to infinite surface areas, thinnest walls for most efficient conduction, most conductive materials, and the like.

LamCo discovered the virtues of large heat pump evaporators. Imagine the heat that an ice cube can take out of a glass of ice tea as it melts. Then imagine how much heat 100 ice cubes can take out of a punch bowl. While the relationship is not quite that linear with the flat plate

evaporator of the LamCo-style heat pump, the ability to take heat from the air is obviously greater than an evaporator with 1% of its surface area, even if a fan increases the heat exchange (and uses energy to do it). While a typical air-to-air heat pump held a few pounds of refrigerant and delivered about 50,000 BTUs (British Thermal Unit) per hour to a home, the LamCo-style heat pump regularly delivered 100,000 BTUs, and held sixty pounds of refrigerant. More important than how many BTUs were delivered into the home was how efficiently they were delivered. The efficiency of the heat exchangers would increase the COPs, and come closer to that Carnot ideal. While air-to-air heat pumps recorded COPs of around two, the LamCo system registered COPs of seven and higher. The highest COP I have heard of with the LamCo system was a twelve. Other variables entered the LamCo equation. The panels would take advantage of direct solar radiation, and wind blowing on the panels would increase the heat exchange and COP.

In LamCo's early days, they tried getting interest in their equipment, but when they talked to engineers, they said their heat pump got COPs of seven, and they were laughed out of engineering offices. Such COPs were "impossible," so the engineers said. They were the professional descendents those engineers who said that [Edison's light bulb was impossible](#), while it lit up the night in Menlo Park. In order to maintain their "credibility," LamCo published data on their equipment [showing it getting only COPs of around three](#). Then they would not be laughed at anymore.

The Early Adventures of Dennis Lee

While LamCo was struggling to establish itself in 1974, another pioneer was having his own travails. Dennis Lee's life story is hard to believe, and if I had not [lived a few chapters of his adventures with him](#), I might think him the greatest storyteller I had seen, making up grand and fanciful tales.

Dennis was born in 1946 and was raised in a family of migrant farm workers, when white people still did that in America. His early years consisted of following the planting and harvest seasons around the United States. At age 13, he was the eldest child, and his family informed him that they could no longer afford to feed him. So, he left home and survived to reach age 18. He then enlisted in the military, and eventually saw combat in Southeast Asia, the bloody kind that most men never completely recover from. He was a medic in the army, and believed in the American dream. People from his background often had Horatio Alger tales as their comforting mythology, dreaming of improving their station in life one day. There is *some* truth in the myth, but myth and reality do not mesh well for that myth's true believers, as there is a distinct class system in America (with more than a little racism in the mix), although less obvious than England's. Dennis took the American mythology seriously, and was such a flag-waving patriot that during his military days he got into fistfights with fellow American soldiers

who said bad things about the United States. Even though he lived the violent life of a soldier, he deeply cared about humanity and wanted to help people.

Because Dennis was a medic, he wanted to become a doctor one day. His first post-military job, however, was loading ships with bombs heading to [Vietnam](#).^[1] He was young with money in his pocket. Coming from his background, life was good.

When I had my first “existential crisis” at age nineteen, my [desperate prayer was answered](#), and a voice in my head suggested that I might like studying business. Dennis’ first encounter with an alien voice in his head was far more dramatic. He had a new Mustang convertible, and was making his way up the ladder to middle class respectability. He decided to borrow money from a bank to establish credit, not because he needed the money. As he walked out of the bank with the money, he walked a man with three children following him. They were emaciated, and the man looked and acted like a beggar. The man asked the bank vice president (VP) for help. His wife had died. They had followed the harvest to Washington, but the harvest was poor that year. They had been sleeping in their car for days, and were starving.

That was a scene not often witnessed in a bank lobby. Dennis had hardly been in a bank before, and the embarrassed bank VP acted like bank VPs everywhere, telling the man that the bank was not a charitable organization, and that down the street was a charity, where he should seek help. The banker was rather cold about it. It would have been unusual for that VP to do anything else, but the scene hit Dennis hard. While watching that tableau, he realized that the [America](#) he had been raised to believe in did not exist. He walked over to the starving man, shook his hand, and said, “I would like to introduce you to Mr. Vice President. His bank has decided to loan you all this money.” Dennis put that wad of loan money into the man's hands. The man's eyes were bulging, as were the banker's. Dennis said, “Furthermore, this is really your lucky day, because I've decided to trade cars with you.” Dennis gave him the keys to his new Mustang and walked out of the bank with him. As Dennis walked out the door, he turned back to the banker and said, “You'll never get that money back as long as either one of us lives.”^[2]

Dennis rode the bus home, crying all the way. His illusions had been shattered, and he decided to put himself out of his misery. He was not in total denial before that day. His experiences growing up, and those he had in Vietnam, had created [cognitive dissonance](#). The facts of life he witnessed contradicted the myth he had been sold, and he came to his stark realization in that bank. Being an ex-soldier, his solution seemed simple. He got his shotgun and put its barrel in his mouth, about to end his misery. At that moment, for the first time in his life, a voice spoke inside his head. The voice asked him what he thought he was doing. Dennis replied that he was going to exit this uncaring world. The voice eventually said, “Hey dummy, if you have a vision for America, don't die because it isn't; live to make it be!” Dennis feels that every moment of his life since then has been gravy, as he could have easily killed

himself.

After that day, Dennis began adventures of a different sort. A famous doctor took Dennis under his wing, and convinced him not to become one. In “[medicine](#),” as with most aspects of American life, myth and reality are vastly different. For Washingtonian youth, Alaska has long been a way to earn good money, especially during the summer. Dennis availed himself of the opportunity, and worked on an Alaskan radar base, in its infirmary. It paid well, especially on a base of thousands of men, living in isolation. Those men spent much of their pay on life’s pleasures, and the local crime syndicate provided the illicit ones, such as drugs and women. Dennis had plenty of naïveté to lose, and thought it merely his good fortune when the only woman in the region became his girlfriend. He eventually discovered that she was part of the local mob’s “recruiting pitch.” They were trying to run their illegal drugs through the infirmary. His girlfriend eventually admitted to their plan. Dennis decided to keep stringing them along, as he told the FBI everything. The FBI eventually pulled off the sting, and Dennis had a price on his head. After one mob murder attempt, Dennis left Alaska with twelve policemen as his bodyguard. At the airport where he departed Alaska, he went into the bathroom just before takeoff, followed by one of his bodyguards. The bodyguard pulled out a knife and tried killing Dennis in the bathroom. Dennis’ soldier instincts saved him, as he fought off the attack and yelled for help. That assailant spent a long time in prison after his botched hit. Dennis still has the scar from it on his arm.

Dennis fled Alaska, and the doctor who talked him out of becoming one helped him. The doctor’s family lived in New Jersey, and Dennis moved there and went to college. In retrospect, fleeing organized crime by moving to New Jersey may not have been the best move, but that is where he landed. Dennis became a highly enthusiastic student, pulling straight A’s and becoming the student body president. When it was discovered that he never graduated from high school (although he attended all 12 years of school), it was a minor scandal. Because Dennis was such an academic star, the college president made an exception in his case. In college, Dennis studied social psychology, and was an Honors College student. He had the freedom to pick a topic of study, and he studied Utopian literature. He also surveyed people door to door, asking about their perception of America’s potential and reality, and discovered that most people felt helpless and unable to change the way America functioned. They distrusted the government, seeing it as oppressor instead of servant. Dennis also attended a conference where B.F. Skinner spoke. Skinner was recently voted the most influential figure in psychology’s history. Dennis heard Skinner and took in the conference’s milieu, to his mounting horror. The theme of Skinner’s talk was about manipulating the public, using conditioning methods. It was a more sophisticated version of Pavlov’s work. At Dennis’ college, he had internship opportunities with politicians, where he could hone the fine art of manipulating the public mind. Today, it is called public relations ([PR](#)).

Dennis stumbled into the world of mass mind control. Pioneered by PR legends such as

Edward Bernays and Walter Lippmann, the term *propaganda* had positive connotations when Bernays wrote a book of that title. Bernays, a nephew of Freud, felt that average people were too stupid to know what was good for them, so their minds had to be manipulated. Bernays helped “engineer” the “consent” of the masses regarding what the powerful did in the public’s name. There was a black side to that engineering of public consent. Bernays designed the American Tobacco Company’s 1929 campaign to [addict American women to cigarettes](#). Bernays’ ruse was to get flappers to adopt smoking as a badge of freedom, the deadliest badge ever devised. Hitler’s propaganda chief, Joseph Goebbels, studied Bernays’ work in designing his propaganda attacks on Jews. Bernays also designed the campaign to [fluoridate America’s water supplies](#). Since the Nazis and Soviet Union both used and planned to use fluoridated water as part of a mind control strategy on subject populations and prisoners, because the [fluorine ion was proven to attack the brain and lower one’s IQ](#), it is legitimate to wonder if that effect is partly why most Americans drink fluoridated water today. The difference was that the Soviet Union and Nazis targeted subject populations and prisoners, where the target in America is the general population. Two-time New York City teacher-of-the-year [John Taylor Gatto](#) is emphatic that America’s public school system intentionally dumbs us down.[3] Bernays was a committed elitist, happily reminiscing in his later years about when his chauffeur was a virtual slave.[4]

Dennis got a glimpse into the profession of manipulating the public mind, and was nauseated. On the brink of graduation, he lost interest and never graduated. He was having a difficult time pursuing the ideal for America that he imagined. Upon leaving college, Dennis got married and went into the home improvement business, and soon his idealism saw him found a company named “Old World Builders,” with his eye set on building a Utopian community one day. It was the early 1970s, and he received a baptism by fire in New Jersey’s business world. Dennis’ first wife gave birth to a premature child who stayed nearly her entire brief life in the hospital. Dennis learned many lessons of [America’s capitalistic shark tank](#) the hard way in those early days, but he learned from them, and was just getting his head above water when the Oil Crisis of 1973-1974 hit. Gas lines, soaring lumber prices and other hardships put many companies out of business in those days, especially in construction. When his lumber supplier panicked and repossessed the building material it sold him, showing up at the construction site and taking it back (not a legal repossession, but possession is nine-tenths of the law, at least in New Jersey), Dennis’ company was destroyed.

Dennis was not singled out; that lumber supplier put most of its small contractor customers out of business the same way. I lived in a deteriorating Ohio town during the 1990s, and the residents said that the 1973-1974 Oil Crisis ended construction growth in that town, and it never recovered, with the “Rust Belt” recession of 1981-1982 delivering the final blow. As Dennis’ company crumbled, a customer stopped payment on a large check to him. Dennis’ company’s checks then began bouncing all over town, and it was curtains for his Old World Builders dream. His child was dying in the hospital when it all came crashing down, and in his youthful desperation, Dennis went to Las Vegas to gamble up the money he needed to save

his company. Naturally, he went back to New Jersey broke, with his child dead, and he faced the music. Dennis was young and still quite innocent to the world's ways. He received what was probably *intentionally* bad legal advice, and knuckled under to the prosecutor trying to keep his kill ratio high.[5] Bouncing those checks in that situation was no crime, but he pled guilty to fraud for bouncing those checks, a decision that still haunts him, nearly thirty years later.

Dennis eventually paid back everybody who was hurt in the company's collapse (a rare act), and had an intimate communion with that voice in his head, and spent days in a room doing what can be called automatic writing. He invented a new kind of card. It was not a credit card, but a savings card. People would use it when buying anything, and the merchant would give money back to the customer. Today, Dennis' idea has reincarnated in a watered down form known as the Discover Card. Dennis will not claim credit for his idea, but that it came *through* him. When he finished his bout with automatic writing, the beauty of what he had created astounded himself and anybody who pondered it. It was a simple yet sophisticated way of uniting consumers and giving them a voice in the marketplace. Although corporate propaganda portrays the consumer as sovereign, in reality, they are largely captive.

As with Mr. Mentor's inventions, what I eventually invented myself, and other works like it, it *does* feel like it is coming *through* you, not *from* you, and yet, although it does not come through the intellect, it still has our individual stamp on it. For instance, Richard Bach declined authorship of *Jonathan Livingston Seagull* for many years, and then Seth set him straight.[6] Dennis had the brilliant idea come through him, but now came the hard part: making his vision a reality. Dennis created a new company to launch his card concept. He named his company United Community Services (UCS), a name that he resurrected in his ventures today. Then Dennis got his real baptism in the business world. He did it in New Jersey again. Since New Jersey is Mafia Central, and the Mafia was constantly muscling in on small businesses there, Dennis' grand dream was a natural for the Mafia to try muscling in on. They tried it a number of times, which led to another Mafia hit attempt on Dennis, which he again survived, and the way he survived it gained the Mafia's "respect," and they never tried it again (he could have the hit men arrested when their attempt failed, but chose not to).

Dennis experienced high adventure in those days. He suffered from rheumatoid arthritis, met his current wife and soul partner, became a Christian and experienced many miraculous and horrific events. The police constantly hassled him because of the Old World Builders days, and arrested him a dozen times. One cop in particular was especially zealous, and did most of the arresting. Customers were having Dennis arrested as a tactic for avoiding debts they owed him. I once asked Dennis if the police ever thought to cease arresting him, because the charges were always frivolous. He replied that I did not understand the sick minds that policemen could have. With each arrest, the charges became more fanciful and unsupportable, but the cop who did most of the arresting became convinced that he had a major criminal in his clutches, and that one day he would catch Dennis doing something truly

heinous. During one arrest, Dennis had a pill of arthritis medicine in his shirt pocket. The cop thought that he finally caught Dennis in a crime. He held the pill aloft in triumph, saying that he had Dennis now. He found drugs on him! Although the lab analysis showed that it was arthritis medicine, the “arrested on suspicion of drug possession” haunts Dennis to this day, even used by [Mr. Deputy](#) in concocting his fraudulent million-dollar bail request.

Dennis spent years getting his UCS baptism, with partners trying to steal the business, the Mafia trying to muscle in, zealous policemen, corrupt business practices (not far removed from Mafia tactics), consumer apathy, crippling arthritis, starvation (literally), losing teeth and other traumas, and his company was on the ropes. During those days, Dennis became a Christian, and a somewhat fanatical one, a fanaticism that he freely admits. The fierceness with which he embraced Christianity has everything to do with his journey and background, I believe, and is understandable. When Dennis is not assailing feminists (Adam’s rib), homosexuals (Leviticus) and others that the Old Testament demotes, he has the love part of Christianity down fairly well, about as well as I have seen, which is about all that really matters.

Dennis decided to give his failing business to the Christian community, and eventually had an audience with one of America’s leading television evangelists. He saw the beauty of Dennis’ vision, and invested more than \$100,000 in Dennis’ dead company to resurrect it. Then the evangelist’s lawyers decided the business’ design looked like a pyramid scheme, and they would not budge from their position. It was not a pyramid, but the evangelist would not associate with something that might appear like one. The so-called pyramid aspect of it was partly what made it work, but the evangelist pulled out of the contract. To this day, he says that Dennis hurt him, but he only hurt himself.

When the evangelist pulled out, UCS was dead. Dennis tried keeping it alive in the evangelist community, but it died nevertheless. At one point, Dennis surrounded himself with Christians at his business. That was one of his life’s more dismaying experiences. Dennis had no idea how fanatical, narrow-minded and intolerant his new Christian brethren could be. There were almost holy wars at Dennis’ company, as each Christian warred with other Christians over their doctrines. Dennis also had visions and realizations, thinking that one day his god would make his plan evident.

One day, as they waited for a sign, to show them a direction to take, one member of their little group had crates of low-flow showerheads that he wanted to sell to resorts on the New Jersey shore. Dennis thought of a way to sell them on a trial purchase plan. They would install them for free, and at the end of the season, the resort owners could look at their energy savings and decide whether they wanted to buy them. If not, Dennis’ company would put their old showerheads back on. It was risk-free to the customer. Dennis dreamed up a corny acronym for the new venture. He called it Project C.O.N.S.E.R.V.E. (**C**osts of **O**wning the **N**ewest **S**ystems in **E**nergy **R**eduction are **V**irtually **E**liminated). They also decided to take advantage of Jimmy Carter’s “moral equivalent of war” on energy consumption and the attendant tax

credits. They sold insulation, burner modifications and other energy-saving equipment. Dennis invented what he believes was the United States' first shared savings plan during the "war on energy." He offered the customer three options:

1. Share the savings and costs with the company.
2. The company pays all the costs and gets all the savings.
3. Buy the package cheaply and keep all the savings.[\[7\]](#)

That kind of strategy became the hallmark of Dennis' programs. They were risk-free to the customer, and usually took years to pay for themselves. The third option was for customers to shoulder the risk of performance and get the savings for themselves. Dennis soon discovered that there was big money to be made in urea-formaldehyde insulation. Dennis has always thought big, and soon had big insulation plans. At that time, he made his first visit to Israel. He experienced a number of paranormal events that girded his faith and provided direction. Dennis tried to change his name to a biblical Josiah David, but the authorities did not allow it because of his Old World Builders conviction. His wife changed her name however, and their children bear that surname. Dennis and his wife slept on their office floor during those days. They hid from janitors; a hot plate was their stove, and their privation great. They often suffered from malnutrition. Dennis lost most of his teeth during his journey.

Dennis approached one of the UCS investors who got hurt when it went out of business. Dennis only needed him to act as front man, with complete ownership, and just let Dennis run it. As would happen countless times during Dennis' adventures, the man let his position go to his head. Although the man's professional experience consisted of being a restaurant cook, he increasingly overrode Dennis. Strutting around with his newfound authority harmed the company, even though it was doing extremely well. One day the cook/investor showed up uninvited and blew apart a business deal that Dennis was putting together. At that point, Dennis had enough and told the investor that he was now on his own, if he thought he was so great at running the show. The cook/owner destroyed the company in one afternoon.

Dennis left the area to go into business with a minister in the foam insulation business. The minister got cold feet after hearing about Dennis' travails, and Dennis soon took on other partners and founded The Foam Company. Dennis soon discovered that the cook/owner was pressing fraud and forgery charges against him, and Dennis was jailed once more. The investor accused Dennis of forging checks without his permission. It turned out that the investor himself had cashed some of those "forged" checks, and the case was thrown out of

court, but it was one more mark against Dennis, publicity-wise. A local newspaper named Dennis the “con man of the year” in those days. When Dennis got back to The Foam Company, there was a new face; an investor who stayed in the background until then, but announced that he was now running the company. He smelled like a mobster, and Dennis had encountered many by that time. Since The Foam Company was being controlled by a mobster, Dennis sought a way out fast, and soon gave his interest in The Foam Company to the mobster and left, to try hiring on with another insulation company. He found a man who wanted to sell his insulation business, and Dennis would buy him out from the operation’s profits.

Without Dennis there to run it, The Foam Company soon collapsed around the mobster’s ears, and he blamed Dennis for it. Just then, Dennis’ wife gave birth to their first daughter, and Dennis became ill. It began as the flu, but soon turned into Guillaine Barre Syndrome, which is a form of paralysis. Those events happened in the late 1970s. The Foam Company mobster talked about breaking Dennis’ legs, but when Dennis became paralyzed with Guillaine Barre, the gangster forgot about him. Being a veteran, Dennis was admitted to a VA (Veterans Administration) hospital. Guillaine Barre Syndrome (possibly a [vaccination reaction](#), and called different names over the years) can be fatal. Dennis became paralyzed from the neck down. The VA hospital began giving him massive doses of steroids. It was an experimental treatment. He was given 100 times the dose that athletes illegally took. He began recovering after a few months, got to the point where he could stand, and they sent Dennis home for Christmas. They forgot to send steroids with him. The next day, Christmas Day, Dennis went into steroid withdrawal. By the time the ambulance arrived, he was in convulsions. The hospital staff later told him that going from 1000 milligrams a day to nothing at all should have killed him. His case was unique, and the VA doctors did not know what recovery he would have, if any. Dennis could barely speak because his condition was so severe.

VA hospitals are notorious for their negligence and abysmal conditions, especially on the East Coast, and that VA hospital was no exception. One time, Dennis got an insane roommate who tried killing him, as he lay there paralyzed. The roommate was caught in the act, just in time, and Dennis never saw him again. Dennis finally began recovering, and could move his arms. He did not recover to the point of standing up when disaster struck again. The VA doctors went home for the weekend, and the nurses took over. He was down to a 500-milligram dose, but the doctor forgot to prescribe his steroids. Dennis talked to the nurse, and said he was supposed to get his steroid dose. The nurse said she did not see any prescription, but she would go check and come back. That was the last Dennis saw of her, and he went into convulsions that night, with his mantra being, “I will not die, I will not die.” He survived the night, to be discovered the next afternoon by the head doctor, who wanted to show him to his medical students, Dennis already being a medical marvel from the first steroid withdrawal incident. When they saw Dennis in a catatonic seizure, they realized they had done it to him again. Dennis could have sued the government for big money, but he sympathized with the staff, knowing they worked in an under-funded, horrible environment, dealing with the wreckage of America’s militarism. However, he was also beginning to think they were trying to

kill him.

Dennis went from 180 muscular pounds to 90 in that VA hospital. He began recovering once more, and one night his nurse came into his room. She was new and brought no steroids. Dennis asked where they were, and she said there was no order for them. That third time, Dennis took charge in the only way he could. He was nearly a vegetable, but he looked the nurse in the eye and willed her to his bedside. He whispered to her that if she did not bring him a phone, he would kill her one day, because he would somehow survive the night. The nurse's eyes got as big as saucers, and she brought in the phone. Dennis called his wife and told her to get him out of the VA hospital, because they would kill him if he stayed there any longer. By the time she arrived, the staff was in an uproar, and Dennis' wife demanded that she be allowed to take him home and be given enough steroids to wean him off them. The doctors protested that he would surely die. Dennis laughed at them, telling them that staying there would mean certain death. They finally relented, and Dennis, his wife and their infant daughter went home...but they had no home. They took a flophouse room and Dennis' wife's family made some contributions to help them through their plight. They survived on charity. At one point, Dennis was able to use the rehabilitation facilities at Princeton's hospital, partly because he was a medical oddity. His condition was highly unusual, and the nearly fatal medical mishaps made him a medical believe-it-or-not story.

The man who Dennis tried buying his business from, before Guillaine Barre struck, was still interested in selling. Dennis could not yet walk, but he had to get active and feed his family. The man "suckered" Dennis into a deal where Dennis paid twice what the man originally asked for, and the man also looted the company's assets, leaving almost an empty shell for Dennis to buy. With Dennis' position, he had no other options. Dennis, as usual, made the company grow quickly to large size. He also resurrected [C.O.N.S.E.R.V.E.](#) The seller had previously gloated to people about how he "took" Dennis by selling the worthless company so dearly to him. Now that the company was quickly reaching the Big Time, the seller told those same people that Dennis had swindled him out of his company. Because some foam insulation companies had poor quality control, foam insulation began creating health concerns. If properly installed, there was not a problem, but poorly made foam could give off too much formaldehyde gas. I would not want a home with formaldehyde insulation, but poor quality control doomed that industry, as well as attacks from the fiberglass insulation industry, in an effort to wipe out the competition. Dennis was getting too successful, and the local fiberglass insulation interests appeared to have been behind banning foam insulation in the county where Dennis operated. Dennis had perfected a method of mixing the foam with computer-controls, and could insulate large numbers of homes in a short time with a "battle wagon" concept, and the business was flying.

At a mall show, where the authorities tried putting his foam insulation company out of business, Dennis showed off many energy-saving technologies. He did not sell wood or coal burning systems because of the pollution, and he did not sell solar systems because he considered them a scam (and most of them in those days were). As a favor to a friend, he

allowed somebody to display a solar system at his mall show, but put it in a dark corner, being more interested in selling his foam insulation and other energy-saving technologies. One man kept asking Dennis about the solar system in the back. Dennis kept trying to discourage him, telling him that his money would be far better spent on insulation. The man kept bugging Dennis about the solar system, and kept telling Dennis that he knew it would work. The man was technically knowledgeable. Finally, as the man bugged Dennis once more, saying he knew it would work, Dennis said, "Sure it will work, but are you prepared to spend \$12,000 on it?" The man replied that he would. That got Dennis' attention. The solar system in the corner was a LamCo demonstration unit. The mall show was hugely successful, and Dennis was cultivating some big plans.

Dennis went to his office building soon after that mall show, and was met by the sheriff. The seller of the business made his legal play, and stole the company out from under Dennis. The nearly worthless company Dennis had bought was doing outrageously well, and the gleam of greed was in the seller's eyes.

The seller's lawyer had drawn up the contract, and a legal loophole was created to essentially steal back the company's stock. Then the seller got a court order, unbeknownst to Dennis. The sheriff escorted Dennis into the building, where the seller sat at Dennis' desk with his feet up on it, and he informed Dennis that it was now his company, and Dennis could leave the premises and never return. Dennis did, and as the seller sat there with his feet up on Dennis' desk, so proud of how clever he was, his ill-gotten empire was already crumbling. Dennis decided to walk away, realizing that the man would only kill the business, and knowing that even if he fought to get it back, the man would destroy the company in the meantime.

Dennis then saw something he had seen before. When people commit crimes such as stealing somebody's livelihood, the darkness in their hearts can turn them truly insane. Even though Dennis walked away, that was not good enough for the thief. He felt it his duty to attack Dennis, believing that somehow heaping on the abuse would, retrospectively, [justify his crime](#). The Europeans did that to justify raping the New World. It is an ancient dynamic. The seller began trying to discredit Dennis with the employees and dealers at his company, showing them newspaper clippings and telling them the lurid details of Dennis' "fraud conviction." Whatever he thought it would accomplish, it did not work. The people at the company had bought into Dennis' obvious talents, not the seller who came from nowhere and could not run anything larger than a street-corner sandwich shop. Most employees and dealers soon quit the company.

Dennis closed his eyes and turned away, and that company went bankrupt before long. Unfortunately, the mentality that business seller displayed is alive and well in America, especially in the small time American entrepreneurial waters, as [filled with capitalistic piranha as it is](#). Dennis was not seeing unusually dishonest or greedy people, nor was his judgment poor. He was getting a healthy dose of what [America](#) is really like.

There are two kinds of greed. There is the ingenious greed of [John D. Rockefeller](#), where he took over the entire oil industry within a generation after it was born. He was a genius, but he used his talent for dark ends that humanity is still paying for. Far more common is *mindless* greed. It is the greed that kills the golden goose, looking for those golden eggs. Mindless greed kills the game for everybody. At least John Rockefeller amassed an empire, which was his goal. People in the thrall of mindless greed destroy everything around them.

In the end, ingenious greed is still not too smart, because it will eventually destroy earth if allowed to guide all actions, as it does in [today's capitalism](#). Mindless greed however, is, well... mindless. Greed always leads to disaster in the end, but mindless greed gets there quicker. When John Rockefeller wiped out a competitor and saw talent among his victims, he would hire them. He soon amassed one of the most capable, and ruthless, groups of men ever assembled. That was part of Rockefeller's genius. Those in the grip of mindless greed are blind to the fact that the key reason that Dennis' ventures are successful is Dennis. As they steal his company, Dennis is the first "useless" thing they throw overboard (along with his "crazy" marketing plans). On more than one occasion, the thieves made their move, and Dennis realized the venture would collapse without him running it, and he offered to keep working for the thieves, even after they stole the company, because he did not want his customers/employees/humanity to get hurt. The thieves kept hacking away at him, trying to bury him even deeper...and the roof *always* caved in on their heads, as they sat there with their feet up on Dennis' desk, marveling at how clever they were.

Dennis could barely walk, his wife was pregnant with their second daughter, and Dennis was once again on the streets. Few people would give a cripple a job, and Dennis applied for food stamps. He finally got a job selling a medical alert pendant, and between that and food stamps the family survived. Dennis started thinking big again, and tried getting his boss to go after hospitals, selling the pendants hundreds at a time. Just then, he got a call. It was that man from the mall show who was enthralled by the [LamCo demonstration unit](#). He knew what had happened with Dennis' company being stolen, but he had to get his hands on one of those LamCo systems. Dennis dug up the name of the guy who displayed that LamCo system, and called him. Dennis asked if he would be interested in selling one of those solar systems, and if Dennis could get a commission of some kind if he sold it. The man promised Dennis a finder's fee of \$1000 if the man bought the \$12,000 system.

The LamCo dealer picked Dennis up, and they went to the man's house. The man lived in an impressive home in a nice neighborhood, and he turned out to be a scientist. Dennis knew nothing of the system at that point, and the scientist and the LamCo dealer talked until 3 AM about many technical issues. Dennis finally interrupted and said, "Have you heard enough to pay \$12,000 for the system?" The scientist handed Dennis a check for \$3000 as a down payment. The next day Dennis met the LamCo dealer's boss, bought the rights to his county for \$25,000 (to be worked off in sales) and went into training to understand the LamCo

system. It was obviously no run-of-the-mill solar system. He soon manned the LamCo booth at a mall show, for half of the leads it provided. He was excited about the system, and bragged to people at the mall that his solar system was making hot water in the mall, at night, while the other solar systems just sat there looking good.

Dennis walked away from that mall with 21 qualified leads, for a \$12,000 piece of equipment that sold to a homeowner. That kind of number, for qualified leads, for something that expensive, to go on a home (one of the most secure sales from a lender's point of view, because homes are immobile), for a weekend of work, was a salesman's dream.

Dennis drove to his first appointment in the broken down ambulance he used for his medic alert pendant selling. He was nervous, and still did not know much about how the system worked. He drove up in the banged-up ambulance, used his walker to approach the house, and was met by his prospective customer, who helped him into his home. The man began bombarding Dennis with technical questions. Dennis did not even understand the questions; much less know the answers. Dennis asked the man what he did for a living. He was a scientist who worked in the Freon division at DuPont, and a refrigeration expert. Dennis gave him the keys to the ambulance and asked him to take a box out and bring it in. Dennis proceeded to have one of his life's most educational nights. The DuPont scientist was ecstatic about the LamCo system, and spent the night poring over the technical data in the LamCo literature. He educated Dennis on everything he could about the system, from the simple to the sophisticated. They got lost in the lesson. Dennis was startled to hear birds chirping, and looked outside to see the sun coming up. They had spent all night going over the LamCo system. The scientist said there was something wrong with the data, and that the [COPs](#) the system could attain should be higher than the literature said. The scientist predicted the system could do a COP of 6 in Philadelphia, when the LamCo literature said it would do a COP of 3. Dennis eventually got the president of LamCo, that Colorado cowboy, to admit they had cut their COPs in half in their literature so the engineers who "knew" it was impossible would stop laughing at them. The letter below from a household-name American corporation surfaced about that time, where the engineer who measured a COP of more than 7 remarked that the LamCo literature predicted a COP of 3.37 under those conditions. LamCo was indeed cutting its claim in half.

Click on image to enlarge

I have cut out the engineer's name, and his company's. Consistent with this presentation of Dennis Lee's story, names are usually left out. They are not important, and I am trying to honor privacy concerns as much as possible. Anybody who researches this issue can easily discover all the blanked-out names. A long-time friend of mine has a father who was an executive at that corporation that tested the system. On his own, partly because it seemed incredible, my friend's father checked into that engineer who signed the letter, and it checked out.

Dennis was running into the opposite problem that most salesmen run into. Usually, salesmen have to stretch the truth to sell their wares. It is called puffery, which is as American as apple pie, and a practice that probably dates back to history's first sale. Dennis told LamCo that he wanted to be able to at least tell customers what it would do, not half of what it would do.

Dennis was excited about the system before his all-nighter with the DuPont scientist. He was practically in orbit after that night. The other twenty leads did not know what hit them. Dennis immediately began thinking big, as usual, and dropped the \$12,000 sales price to \$8500. The cost of the system to him to buy and install it was \$8000, and he figured he could increase sales by decreasing his margin. Those twenty other leads had already heard the \$12,000 price tag, and all immediately went for it at \$8500, plus Dennis was so on fire that he could have easily sold them for \$12,000. Dennis was thinking *very big*, though.

Dennis met his East Coast distributor, and hoped that twenty-two sales in one month was good enough. He had given most of his commission away in discounting the systems, and asked them to forgive his lack of performance. Dennis thought the systems were easy to sell, and wanted a chance to *really* start selling them. The man who had just stolen Dennis' company stalked him, and tried outbidding Dennis for the county's LamCo dealership. Dennis was worried, and the East Coast distributor took Dennis out to lunch. Dennis beseeched the man to give him another month to try selling more systems. Dennis hurriedly ran ads for salespeople, and called his customers and offered them \$500 finder's fees for any friend who came to Dennis' presentation at the ritzy DuPont hotel in Wilmington, Delaware. Dennis used his deposit money to rent out the ballroom and buy a five-course meal for those who showed

up. Dennis arranged the room, and Mr. East Coast Distributor brought the LamCo demo unit to the facility, and as they wheeled it up through the ballroom, the man marveled over the place, sneaking a glass of champagne from a table, not suspecting that the room was reserved for Dennis' potential customers.

Dennis unveiled his Systems for Savings (SFS) program that night. Dennis was selling the LamCo system for \$10,000 apiece. It qualified for Carter's Renewable Energy Source Tax Credit, so the federal government was subsidizing \$4000 of the purchase price. The remaining \$6000 balance could be paid for from proven energy savings. At that time, in that region, the electricity and gas/oil curve had the system paying for itself if it only got a COP of two. Dennis found another rocket ship. He sold 280 systems that night, and sold 300 systems in two months. Dennis thought it was good enough to get the county dealership free from the clutches of the thief who stole his last company. Mr. East Coast Distributor was at the show. Although he was cool with Dennis at their lunch meeting, he dropped his poker face after the show. He begged Dennis to be his partner for the East Coast, and admitted that LamCo had not even sold twenty systems on the entire East Coast during the past three years. The dealers he sold usually only sold the system they got with the dealership before they went out of business. Mr. East Coast Distributor had sold nearly as many dealerships as systems. Three hundred in one county in two months was not a bad start.

The East Coast distributor was technically proficient, but could not sell a system. That was the main problem with LamCo. Their pitch went into technical talk, and only technical types would buy them. When Dennis arrived on the scene, the LamCo customers were so technically proficient that half of them had installed the system themselves. Dennis knew that Mr. and Mrs. Average American would neither comprehend nor be impressed with the technical talk, especially if they had to part with \$12,000 for it, based on information they largely could not comprehend. They wanted to hear it would save them money. With Dennis' SFS program, the customer really did not even have to care if it worked. All their risk was removed with Dennis' program. That was part of Dennis' genius. More than a hundred companies came and went over the years, trying to make the LamCo system happen, but Dennis was the only one who knew how to sell them.

I have never seen a more astute observer of the human condition than Dennis. Dennis once told me that the reason all those other LamCo dealers and others failed was because they did not understand that the LamCo system was not one that saved *energy*; it was one that saved *money*. All the times Dennis would have his companies stolen, the thieves immediately discarded Dennis' "crazy" marketing plans, and tried selling the systems for cash (the quick kill). They always said, "Mr. Customer, this is a great piece of equipment, and the price is \$10,000 cash." They all promptly went out of business, unable to sell any systems. Dennis' marketing programs were the real gold, not the LamCo system, but the greed-blinded thieves could never comprehend it.

Dennis did not want to have a partner, as his previous experiences soured him on that.

Dennis formed a joint venture with Mr. East Coast Distributor. Dennis would sell them as fast as possible, and Mr. East Coast Distributor could try installing them as fast as Dennis sold them. The market for the LamCo system in America was around 5 to 10 million homes, and Dennis wanted to go after them. The LamCo equipment was exactly what Carter's tax credit was encouraging. A one time tax credit of \$40 billion would decrease fossil fuel consumption by four times that much over twenty years. It was what the energy conservation movement was all about, and nobody sold anything remotely close to the LamCo system's performance. Tin can solar collectors on roofs were pathetic pretenders compared the LamCo system.

Dennis soon met the [Colorado cowboy who founded LamCo](#), and Mr. Colorado Cowboy only wanted Dennis to order 20 to 30 systems a month under the current deal. With the LamCo equipment and Dennis' experience and imagination, a million plays became possible. At about that time, the Delaware attorney general began looking into LamCo's "too-good-to-be-true" offer, which was actually the "it-does-twice-what-we-say" offer. The systems installed in the Philadelphia area qualified for preferential electric rates from electric companies, because they then heated their homes with electricity. Typical Philadelphia customers saved about 70% of their heating costs. In the example below, the customer saved *100%* of his heating costs, because of that preferential rate.

Click on image to enlarge

LamCo was trying to take the company public (sell its stock to the public), and Dennis was the biggest thing LamCo had ever seen. Dennis was flying high, moving to Long Island, about to carpet New York State with LamCo systems. Then the stock deal fell apart, Mr. Colorado Cowboy brought in new management, and suddenly LamCo made it hard to do business with them. They were not filling Dennis' orders, and began acting strangely. Then Mr. Colorado Cowboy called Dennis at 3 AM, telling him that LamCo had been put into a Chapter 7 (liquidation) bankruptcy, and for \$15,000, they could pull it into a Chapter 11 (work out the debts with creditors) bankruptcy. Dennis worked out a deal with LamCo to manufacture the systems and give LamCo a royalty. He sold dealerships, getting a ready-made sales force. With the LamCo system and Dennis' [SFS](#) program, the sky was the limit. They quickly trained their first dealers. Some of the dealers smelled like mobsters, and Dennis told Mr. East Coast

Distributor that he would not deal with mobsters.

LamCo's bank acted strangely. Dennis negotiated a deal with Mr. Colorado Cowboy's engineer buddy (who took apart that heat pump on Mr. Colorado Cowboy's roof [that fateful day](#)) who was his second in command, and Dennis paid more than \$400,000 to LamCo to buy two-thirds of the company and keep it alive. Days after giving nearly every cent he had to LamCo, Dennis came to work to be surrounded by Mr. East Coast Distributor and two ex-soldier karate experts, who took him into a back room. The "deal" they gave him was that if he signed over his company to them, they would not kill him. Mr. Colorado Cowboy apparently had some deal going with Mr. East Coast Distributor, and when Dennis cleaned out his bank account, Mr. East Coast Distributor got some, Mr. Colorado Cowboy got some, and so did their new Mafia buddies.

Once again, Dennis was kicked out of his company. That time, it was worse than that. The two karate goons who helped kick Dennis out of his company lived with Dennis, because they needed help and Dennis took them in. Not only did they kick him out of his company, Dennis was not even allowed to go back to his home and remove his family's possessions. They were out on the street with only the clothes on their backs. Worse than their clothes and other possessions being taken, all of Dennis' materials from his UCS days, materials he needed to resurrect UCS one day, were also now beyond reach, and that was the worst loss of all for Dennis. Those goons probably never realized how close they came to dying at Dennis' hands, as Dennis seriously thought of settling things the Vietnam way. Dennis then had his moment of truth. He conquered the urge, and has never considered violence as a solution again. I am a pacifist, but [I well know the urge to kill people](#).

Years later, Dennis heard what had happened. Mr. Colorado Cowboy took his chunk of Dennis' money and lived in South America for a while. Mobsters took over the operation that Dennis and Mr. East Coast Distributor had jointly ventured on. Then they pulled off a real scam, taking in more than a million dollars in dealership and system deposit money, and then folding the operation. That is a [familiar tale](#). The police rarely catch the real crooks, nor do they really seem eager to. Mr. East Coast Distributor "disappeared" soon after he helped rob Dennis of his company. He probably got cement shoes from his new gangster buddies.

When people catch a glimpse of Dennis' grand vision, they often get dollar signs in their eyes and greed takes over. In addition, when the sledgehammer of the system crashes down on Dennis as the energy monopolists protect their turf, fear takes over with people, and sometimes there are grotesque combinations of both. I have watched people participate in stealing Dennis' companies while he was in a headlock from the establishment, although they knew deep down that if they successfully stole his company and did something productive with it, they would end up like him. I had to wonder what, if anything, was going on inside their heads. The most common explanation Dennis has heard as he suffered those slings and arrows is: "It's nothing personal; it's only business."

Dennis Makes a Run at It

About the time his company was stolen once more, Dennis went home to Yakima to visit his family, and show them his fourth child, his first son. His two daughters, born between his first child and last, are adults today. Dennis' son died of crib death while visiting his family, and Dennis and his wife could not seem to move away, especially with their East Coast lives destroyed. It was early 1984. Washington was the hydroelectric state, and at the one-cent-per-kWh price that prevailed before 1982, there was no way that Dennis could ever sell his system, energy being so cheap there. Electricity was so cheap that much of Washington heated with electricity, and electricity-intensive industries such as [aluminum refining](#) moved there, to take advantage of cheap electricity.

I remember the TV news in the [winter of 1981-1982 in Seattle](#). Nearly every night there was a top-of-the-hour story about "Whoops." During the Nixon years there was nuclear euphoria, and the Nixon administration set a goal of 1000 nuclear reactors in America by the year 2000. During those years, a study showed that the watery Northwest would run out of hydroelectric power before long, and the Northwest utilities, led by the Bonneville Power Administration (BPA), formed the Washington Public Power Supply System (WPPSS), and billions of dollars of bonds were floated to build five nuclear reactors. The repeated energy crises in America, which lowered the demand curve, the Three Mile Island accident, skyrocketing projected costs for building nuclear reactors and the like doomed Nixon's nuke-in-every-county plans, and the WPPSS nuclear plants were mothballed, and in January 1982, Moody's bond rating service suspended ratings on the bonds for the 4th and 5th reactors. In July 1983, WPPSS declared a formal default on \$2.25 billion of its bonds, triggering the largest municipal bond default in U.S. history.[\[8\]](#) WPPSS began being called "Whoops" in the early 1980s.

When Dennis was in Yakima, electricity had just leapt from one cent to three in short order, and five cents appeared to be around the corner because of Whoops. The electric companies were running full-page ads, and suddenly electricity conservation was the most economical form of production, so their ads stated. A heat pump that averaged a COP of five in the Minnesota winter began looking very feasible in Washington. Yakima was in apple country, and they used hot water and hot air to process the apples. Originally Dennis thought that he could sell his heat pump to apple processors. Dennis began doing experiments in the Yakima summer, and the LamCo system was getting COPs of 12. A business tycoon who ran Yakima approached Dennis and told him he would not succeed if the tycoon did not allow it. The tycoon kind of compelled Dennis to become his partner, and Dennis had nothing else going on, so he joined with him.

Dennis' brashness and brilliance had been demonstrated long before, during his East Coast

days. The LamCo-style heat pump remains the best heating system the world market has ever seen, and in the early days of his involvement, Dennis labored mightily to get American business interested in it. He canvassed Wall Street; he approached heat pump manufacturers; he did everything he could to create a new industry around the LamCo-style heat pump. One day, his persistence paid off, and the plant manager of America's largest heat pump manufacturing facility let Dennis into his office. Air-to-air heat pumps attained a COP of around two in those days, but were relatively easy to install. The plant manager let Dennis into his office and said, "Well, Kid, so you have a superior heat pump, eh? I know about your heat pump. Even if it outperformed ours, the idiots in the field could never install one of yours properly. Come with me, Kid." The plant manager then led Dennis into the facility. It was one of Dennis' more sobering experiences. As far as the eye could see, sparks were flying and people were building heat pumps. After letting Dennis take in the scene for a minute, the plant manager said, "We did two billion dollars worth of business last year, Kid. What did you do?"

The plant manager was being slightly disingenuous, if a tad sardonic. The air-to-air heat pump was easier to install, but performed poorly compared to a properly installed LamCo-style heat pump. The plant manager was partly accurate. At that time, installing a LamCo-style heat pump was the province of a highly trained refrigeration mechanic, and the panel array was fabricated at the customer's site, which not only took time, but also required skill and experience. Although half of the early LamCo customers installed their own systems, many did not work well because they were not properly installed. After the panels were placed, the tubing braised and the system sealed, then the lines had to be evacuated by a vacuum pump for about 24 hours, then the system needed to be charged with refrigerant, there was a "balance" the system needed to attain, and other problems.

There was a newborn and evolving science of making the LamCo-style heat pump work properly, which was being discovered by trial-and-error in the field. Air-to-air heat pumps were about at the appliance level of development, being relatively easy to install, although their performance for heating was poor. The plant manager was not going to admit to Dennis that electric companies were the marketing conduit for heat pumps, as selling a heat pump usually meant replacing or complementing something that burned fossil fuels, so the heat pump was usually a way for the electric companies to expand their market into fossil fuel territory. A COP of two doubled the efficiency of the electricity used, so it could compete with fossil fuels in certain markets. A COP of six would mean only one unit of electricity used for six units of heat farmed from the environment. That is not much electricity, and in an all-electric state like Washington, replacing an electric heater with a LamCo-style heat pump would mean an 83% decline in electric consumption for heating. In Washington, that was a lot more conservation than the electric companies had in mind, though it would take Dennis awhile to figure that out.

Soon after Dennis got into the business, it became obvious that the way LamCo heat pumps were installed would not work, at the level of sales that Dennis had in mind. So Dennis became involved with developing the technology of the LamCo-style heat pump. In all the libel and derision directed Dennis' way since 1986, none of his detractors have ever mentioned how

he helped develop the LamCo-style heat pump. Dennis was instrumental in making it better. He invented what he called the “heat-injector,” which was a LamCo-style heat pump with an upright panel array. In the above pictures, that kind of array is seen; those upright panels, white with frost, looking like a big weather vane. Not only was the panel array pre-fabricated, it would also be evacuated and charged with refrigerant at the factory. With the heat injector, the panel array was placed on top of the system’s guts, making the whole thing a self-contained appliance, with installation largely limited to hooking up the water and electric lines. Dennis was instrumental in making numerous improvements in the technology, although he often had to fight his engineers and technicians, as most could not think past their textbooks and training.

Dennis is not a scientist or mechanic, but he had the kind of creative and thoughtful mind [that most engineers do not have](#). In order to become a capable LamCo-style heat pump technician, refrigeration mechanics had to discard much of what they learned in the refrigeration business. In all refrigeration and air conditioning applications, the goal was removing and getting rid of heat. The LamCo-style heat pump did the opposite: acquiring environmental heat. While the evaporators in industrial freezers and air conditioning systems took heat from closed rooms at constant temperatures, the LamCo-style heat pump’s evaporator sat in the sun, wind and rain, taking heat from the environment. An air-to-air heat pump held a few pounds of refrigerant; the LamCo-style heat pump held sixty pounds.

That huge evaporator array, sitting in the sun, taking heat from the environment, introduced parameters never before encountered in the refrigeration world, and new science and practice had to be developed. For instance, in refrigeration training, the rule of thumb was that a system could process about 12,000 BTUs of heat for every horsepower of refrigeration pump used.[\[9\]](#) The pressures generated by the LamCo-style panels were much higher than a standard heat pump or refrigeration application, so the LamCo-style systems often delivered about 25,000 BTUs per horsepower, which refrigeration textbooks said was impossible. Refrigeration mechanics and engineers had to flush that information from their minds, and many could not do it. Dennis did not have those limitations of education.

Dennis was not simply trying to get heat pump manufacturers interested in the LamCo-style heat pump. He was also knocking on Wall Street’s door, trying to get somebody to see what that heat pump, combined with Dennis’ marketing plans, could do. There was so much money on the table, from the U.S.’ awesomely wasteful energy practices, that an immense market awaited a technology like the LamCo-style heat pump. Dennis’ marketing plans *were* ingenious. Carter’s tax credit could fund the entire cost of selling, making and installing the LamCo-style heat pump, and customers risked none of their money. Until one has seen the shark tank of American capitalism up close, one might think that something like that would take off immediately. There are many examples of truly extraordinary technologies that have been around for generations and still marginalized, such as [Rife’s](#) and [Naessens’](#) microscopes, [Brown’s Gas](#), etc., because such technologies threaten the cash cows of established

technologies. The problem is probably greater with the LamCo-style heat pump. Not only were there technical problems to overcome, there may be no industry that [protects its turf as ruthlessly as the energy industry](#), as Dennis was about to discover.

Virtually without exception, businessmen were incapable of seeing the genius of what Dennis was doing. Dennis designed a program that would sell like hotcakes, but the profit would not be fully realized for several years. Such a plan seemed ludicrous to most businessmen, especially when they smelled the blood in the water of a quick kill. However, just before Mr. Colorado Cowboy helped steal hundreds of thousands of dollars from Dennis as they collapsed LamCo, Dennis finally got the attention of somebody who understood. He was the chairman of the board of a household name financial corporation. He understood what Dennis was doing, and Dennis was getting to the short strokes of getting that corporation to invest *one billion dollars* to carpet America with the LamCo-style heat pump. Just then, [Mr. Colorado Cowboy and friends made their play](#), blowing apart the billion-dollar deal so they could chisel a few hundred thousand from Dennis. Those chisellers and gangsters only wanted to steal a couple million dollars, and they blew apart the greatest opportunity America had for real energy conservation during all the years that have passed since the Oil Crisis of 1973-1974.

In Yakima, Dennis encountered a different kind of mindlessness. Mr. Rich, who ran Yakima, thought that those LamCo panels did not look sexy enough. He told Dennis that nobody would buy one of those systems, as ugly as they were. Dennis replied that people would not care what they looked like, if it saved them \$20,000 in energy bills. Soon after Dennis became involved with Mr. Rich, they became involved with an inventor who was making a solar system that looked like R2D2 from *Star Wars*. It was called "The Bubble." Its beauty entranced Mr. Rich, and he told Dennis that it would sell because of its sexiness. Dennis married his heat pump technology to it, and it eventually got a COP of three under good conditions, but it was not going to save the customer that much money. Mr. Rich fought Dennis every step of the way, and eventually told people he did not need Dennis anymore, with his "crazy" ideas. It was late 1984, and Dennis had wasted enough time in Yakima. There was only one year left of Carter's tax credit, and he had only one more year to get the industry off the ground. Driving a beat up station wagon with bald tires over the Cascade mountains during a snowstorm, with his wife praying that they would not be killed, with twenty dollars in his pocket, Dennis rolled into Seattle with nothing but his resolve and talent.

Dennis has always built his companies from scratch after they were stolen or wiped out. He and his wife have developed unique skills from having to do that time after time. Building a company that way is an amazing feat. In Seattle, Dennis entered a new phase of his adventures. When LamCo swindled him, what hurt him almost more than anything else was the bank that held the lien on LamCo's assets would not let Dennis get the rights to LamCo's patent.

Patents are largely a fool's dream of protection from competition. Patents usually only protect

large companies from other large companies, and even then the protection is more theoretical than actual. Wiping out the theoretical patent protection of the little inventor has been an American specialty for generations, particularly noticeable in the [automobile industry](#).^[10] Dennis did not know it, but the patent was worthless. Nevertheless, people thought it was worth something, and what happened, unbeknownst to Dennis, was that a West Coast LamCo dealer seized that patent through the bank. In Seattle, that dealer bragged to Dennis about what he had done, with no inkling of what his play had killed. When Dennis heard that guy bragging about it, he laughed. Obviously, it was not meant to be at that time, when Dennis was on the brink of his big deal.

In Seattle, a bank had gone into business, making the LamCo heat pump from the original patent that the dealer essentially stole. It was an incredible stroke of serendipity. The bank had invested a million dollars, and had a manufacturing facility. They had virtually no idea what they were doing, however, and were building them from the ten-year-old patent. With Dennis' help, the technology had advanced a long way from what was presented on that patent, and the bank also trying to sell them for cash. Their efforts were doomed. Dennis showed up in his beat-up station wagon and no place to sleep, and told the bank that their problems were over, and did not take Dennis long to start making waves. In February of 1985, with less than a year of the tax credit remaining, Dennis bought out the bank's dealers and was going to bail the bank out. They would not only recover their investment, but Dennis would take them to the moon with him. He was about to carpet Puget Sound with the LamCo-style heat pump.

Dennis had been trying to attract the electric companies' interest, believing the full-page ads about energy conservation. In reality, the electric companies were perpetrating a huge fraud upon the public, and Dennis threatened to ruin the racket. The economic reality was that the electric companies sold electricity provided by the Bonneville Power Administration (BPA), from all the hydroelectric dams that dotted the watery Pacific Northwest. The BPA was the wholesaler, and the local electric companies were retailers. Partly because the federal government absorbed most of the dam-building costs, residents of the Pacific Northwest had the United States' cheapest energy bills. Because electricity was so cheap, electricity-intensive industries such as [aluminum refining](#) were located there, and many homes used electricity for heating, generally with electric heaters.

Electricity, [when generated using fossil fuels](#), is an inefficient method for heating, as energy is wasted at the power plant due to entropy. Hydroelectric energy is not inefficient in that way, as it merely converts one form of mechanical energy (flowing water) to another (electricity). There are no thermodynamic, energy-conversion issues to contend with. Hydroelectric energy, however, is ultimately derived from the sun's energy that fell on earth's oceans, the latent heat of vaporization being carried in clouds to be dumped onto mountains as rain. The energy is released as gravity brings the water back to the oceans, and is farmed by using dams and hydroelectric turbines, like a windmill farms the energy of wind, which is also created by solar

energy. In U.S. energy economics, at the macroeconomic and microeconomic level, burning fossil fuels at the home is several times cheaper in obtaining a BTU of heat energy than it is to burn that fuel in an electric plant and use the resultant electricity to power an electric heater in the consumer's home. However, when ratepayers paid one cent per kWh for their electricity, heating with electricity was cheaper than fossil fuels. So, like no place else in the United States, many Washington homes heated with electricity, and most of an all-electric home's electric bill was used to heat the home.

When electricity went to three cents and higher to pay for Whoops (I pay more than six cents per kWh in my Seattle-area, all-electric home), as the ratepayer, as with the taxpayer (as in the [S&L scandal](#)) always holds the bag in the end, fossil fuel heating suddenly became a viable option for Washington residents and businesses. If Washington ratepayers en masse abandoned electric heating for fossil fuel heating, the local electric companies faced a disaster, as far as local markets went. The electric companies cooked up a scam to keep their markets, and the ratepayer was going to pay for it. They concocted the "Weatherization Program." On one hand, there would be *some* benefit for the consumer, but the purpose was to preserve Pacific Northwest electric company revenues and profit margins. When the 1970s energy crises rolled through the world economy, Americans and residents of other industrialized nations discovered the benefits of insulation and other energy-saving technologies. The projected increase in energy demand for U.S. households did not materialize, which helped doom Whoops. Energy consumption per household in the United States in 2002 is about a quarter less than it was in 1973.[\[11\]](#) Most of the savings came from insulating homes, to lower the energy consumption for heating and cooling.

If a Washington resident changed from electric heating to gas, for instance, his electrical usage would fall by more than half. He would also need to invest thousands of dollars in a gas furnace, and probably have to pay to have ductwork run through the home. The prospect of changing from electric baseboard heating to fossil fuel central heating could be daunting, but if a homeowner's electric bill increased by a factor of six due to Whoops costs, it would be worth it. Even more likely was a homeowner with a central electric furnace converting to a gas furnace. The Weatherization Program was designed to prevent homeowners from converting to fossil fuel heating. A cornerstone of the Weatherization Program was selling heat pumps to residents. At a COP of two, a homeowner's electricity consumption would be halved for heating. A standard heat pump cost several thousand dollars, and did not qualify for the renewable energy tax credit. If the homeowner's heat pump costs were subsidized, he might be induced to buy it rather than a gas furnace. It was still a hard sell, but if the electric companies manipulated the consumer with a propaganda barrage, they might pull it off. That is what all those full-page ads that Dennis saw were about.

Dennis thought that if the electric companies gushed over a heat pump that saved half of the homeowner's electric consumption, they would be ecstatic about the LamCo-style heat pump that not only saved 85% of consumption, but also qualified for Carter's tax credit. However,

that was far more conservation than the electric companies had in mind. The electric companies were looking at perhaps \$20,000 in lost electric revenues for every LamCo-style heat pump installed in Washington, during its estimated life. It simply came down to money. The LamCo-style heat pump could have meant billions of dollars in lost electric revenues for the electric companies.

It is easy to see that in the long run it would be good for everybody if the energy conservation that the electric companies publicly said they wanted, came to pass. No American corporation, however, looks far beyond next quarter's profits. [Making a profit is what it is all about for corporations](#), and maintaining market share, especially a monopolistic/oligopolistic one, is how those profits are ensured. Eliminating 80% of heating consumption in all-electric homes would be bad for business, as far as the electric companies saw it. The Pacific Northwest's electric companies vigorously promoted heat pumps in 1984. There were heavy inducements waved under homeowners' noses in those days. The electric companies would subsidize the heat pump purchase, offering zero-interest financing and other gimmicks. As Dennis began figuring out what was *really* happening, he looked at the numbers. If a homeowner was induced to buy a heat pump, raising the general electric rates paid for the "subsidy" he received. Essentially, the homeowner who bought a heat pump had the purchase unwittingly subsidized by his neighbors. That was the game the Pacific Northwest electric companies were playing in 1984, and Dennis stumbled right into it, thinking the electric companies would throw him a ticker tape parade. He got their attention, all right, with the BPA's energy conservation department thinking of Dennis and nothing else, for months, as [eventually admitted by the BPA](#) itself. Dennis and his heat pump was the scariest thing they had ever seen.

Accordingly, they began throwing their weight around early on, as Dennis made a run at it before the tax credits expired at the end of 1985. That bank was on the fast track to going out of business, with their investment in the LamCo-style heat pump. In February of 1985, with less than a year to go, Dennis kicked it into high gear in Seattle. He bought out the bank's dealers and sold more than 100 systems. He got a different bank to finance the tax credits for his [SFS](#) deals. Suddenly, that bank reneged on the deal. Dennis was going to bail out the "LamCo" bank, and use them to give the business credibility. He contacted the "LamCo" bank, and thought they would be happy to see system orders and the high-quality contracts he had with homeowners. He met with the bank representative, and Dennis got his first inkling that something was awry. The bank representative was impressed with Dennis' more than 100 contracts (the bank had sold only forty systems during the previous three years), but the bank did not even want to do business with Dennis. Dennis was stunned. "Why?!" he said in amazement. The bank representative then gave Dennis the news:

"Off the record, Dennis, our bank president is embarrassed to do business with you. There's

something big going on here and I don't have any idea what it is, but I've heard that no bank is going to take your deals. We don't even want to be involved with this thing. I know what you are doing and I see nothing wrong with it, but I don't know what I can do. Someone is out to get you.”[\[12\]](#)

After delivering that unofficial message, the bank representative officially fired Dennis as a dealer of their heat pump. All Dennis ever wanted was somebody who could build, install and finance them as fast as he could sell them. There was another company in California, also on its way out of business, which was making the LamCo-style heat pump. Eventually, *everybody* fell by the wayside, that bank even going out of business, and Dennis eventually had to make the systems himself.

Dennis just went for sales, stacking up contracts. With no local bank willing to fund the contracts, Dennis instructed the salesmen to ask the customers to go to their banks themselves and get the tax credit loan, on their own account. The banks would not even allow that, telling their customers that Dennis' company was a scam and he would skip town with the money. Dennis was dumbfounded. *Somebody* was out to get him, for sure. He just did not know who it might be.

In the spring of 1985, Dennis finally found another person who understood. It was another chairman of the board, of a finance company in Spokane, far enough away to not be intimidated by whoever was poisoning the Seattle climate. The man became excited. He was a shrewd businessman who built a finance company from scratch. He understood what Dennis was doing, and wanted to be part of it. To this day, he is the only man who ever committed serious money to fund Dennis. Mr. Financier also wanted a piece of the action, and one of his employees got Dennis involved with some people who sold Dennis a shell company. [\[13\]](#) When Dennis bought the shell, he owned more than 85% of the stock, and Mr. Financier got a 10% piece of it. Dennis quickly reached 1000 contracts for the system, and Mr. Financier committed a \$10 million line of credit to finance them.[\[14\]](#) It was looking like Dennis was finally going to make that hay while the tax credit sun still shined. He thought he just might build that industry for the superior technology, as he had dreamed of for several years by that time.

An article appeared in the local papers, in early June 1985, just as Mr. Financier was coming on board. The article called Dennis' company a scam, the equipment worthless, and stated that it would not qualify for the tax credit. The article further stated that a local electric company spokesman called for the Attorney General's office to investigate such an obvious scam, as well as all solar companies in Washington. The LamCo system had *always* qualified for the tax credit. It was not a typical heat pump, and Dennis eventually testified to the IRS regarding the LamCo-style heat pump, and even tried helping the government make the tax credit accountable, as the solar systems were largely *real* scams. The electric company even

went so far as to say that they had repeatedly asked Dennis' company for information about the LamCo-style heat pump, and Dennis had stonewalled them. That was in the Big Lie category. The opposite was true. By that time, Dennis had done everything he could think of to get the electric companies interested in his heat pump. He still thought they would love what he was doing. One day, he even had one of his units put on a truck, and had it running in the electric company parking lot, begging them to come out and test it. They refused to even come out of the building.[\[15\]](#) When that article appeared, Dennis began suspecting who might be "out to get" him.

A few days later, Dennis bought out that "LamCo" bank. In July, it was looking like Dennis was going to make it happen. They reached 1000 contracts, even though the electric companies were trying to talk customers out of signing Dennis' contracts, even though there was [zero risk to the customer](#). Just then, the Attorney General's office began an investigation of Dennis' company. Dennis heard the rumors and called the Attorney General's office, asking them what was happening. They denied even knowing who he was, for another Big Lie. Dennis was besieged with reports that all the electric companies were openly calling his business and heat pump a scam. At the same time, a man came to Dennis' office and sold himself as a consultant who could smooth things out between Dennis and the electric companies. He was a [corporate hit man](#) from the BPA. Before 1985 was finished, he would be responsible for many evil deeds, including the [death of one of Dennis' employees](#).

Dennis was getting tired of the rumors and lies coming from the Attorney General's office and the electric companies, so he called a meeting of all the electric companies, to be held on August 15, 1985. During the summer of 1985, Dennis' stock in his company made his net worth about \$50 million. They built a factory and were training installers, and it was looking like Dennis was going to sell and install thousands of systems before the tax credit expired at year's end. After fervent beseeching of the electric companies to attend, the August 15th meeting was largely only attended by Dennis' new employee, the [BPA hit man](#), and two young people who posed as university students interested in conservation. It later turned out that those two "college kids" were "investigators" for the Attorney General's office. They later acted like children during the "investigation," giggling at highly inappropriate times, and Dennis would eventually call them Hansel and Gretel in his writings.[\[16\]](#) Dennis filmed the meeting that all the electric companies were invited to. It was a catered event, and Dennis spoke at the nearly empty table, set with the food for the electric company representatives that never showed up. The next year I watched that video, and it was the only time I ever saw the BPA hit man.

Ms. Deputy Attorney General led the investigation. By the end of summer, Dennis was flying high, with sales streaming in, systems being manufactured and installers trained. Mr. Financier's stock in Dennis' company was worth millions of dollars, and he sold Dennis a plush house he owned in Bellevue (with a weight room and pool in the basement), for more stock in the company, and Dennis was finally making the Big Time. Unknown to Dennis, the evil deeds were just beginning. The electric companies were not going to stand by and watch Dennis

wipe out their market, even though they publicly said they wanted what he was doing. They called in their favors.

As autumn rolled around, the company was in a frenzy to make and install the systems they sold. Although I did not witness that heyday at his Seattle company, I saw it in Ventura, and it was like watching a rocket take off. Dennis' efforts in 1985 in Seattle stand today as the biggest effort ever made in the United States to bring viable alternative energy to the marketplace. Nothing I know of has come close. Accordingly, the energy gangsters' tactics became the most vicious. Ms. Deputy Attorney General had no leg to stand on regarding her "investigation." Even though the "scam" rumors abounded, the customers risked none of their money with the [SFS](#) program. The system had been installed all over the United States, and worked beautifully in climates far harsher than Seattle's, such as in Minnesota, where many happy customers of the LamCo-style heat pump lived. The system was legitimate, the marketing program was the most risk-free one the American market had ever seen, and Dennis was carpeting the Seattle area with salesmen who were closing on about 70% of their presentations, many who had no experience selling anything. In the marketing and sales world, what Dennis was doing was unheard of.

There were many hazards and oddities of those days, and some bear mentioning. Dennis' company took off like a rocket for a few reasons. One was the market that Whoops and the hydroelectric situation had created, along with the tax credit subsidy and the world's best heating system. Add in a marketing Einstein like Dennis, who is the Indiana Jones of alternative energy, and it was an explosive situation. Dennis created a "cookie cutter" marketing program, and flooded Seattle with his program and salespeople. As I later saw in Ventura, the skill was in creating a program that worked, and then it was the world's easiest sale. Many of Dennis' salespeople quickly got big heads, thinking that their big incomes and easy sales were because they were such brilliant salesmen. With Dennis' program, a chimpanzee could have closed those deals.

The electric companies were not going to take it lying down, and took advantage of [how the American public is brainwashed](#). Advertising and [public relations](#) (PR) are methods that corporations use to manage their image, to help them appear benevolent, when they are really all about making money any way they can (appearing to serve others, [when really the goal is being self-serving](#) - the classic tactic). If they were truly benevolent, not much PR work would be necessary. Virtually all advertising and PR is designed to change people's perception of reality. In the wake of Whoops, the Pacific Northwest electric companies suddenly discovered the virtues of conservation and created conservation departments, putting on the appearance of being the consumer's best friend. When customers heard the incredible, zero-risk sales pitch given by Dennis' salesmen, many called the conservation department of the local electric company, asking them if the Lam-Co-style heat pump was a good conservation idea. That would be similar to asking a Catholic priest what he thought of the [Cathars](#) in about 1215. The electric company conservation departments responded unsurprisingly, given their true goal of

eliminating the competition, especially one as scary as Dennis; they told their customers that Dennis' company was a scam, the heat pump worthless, etc. They told every lie they could dream up to frighten away those customers from dealing with Dennis' company. To cap it off, they said Dennis was being "investigated" by the Attorney General's office, an investigation that the electric companies publicly admitted that they initiated.

A fortunate thing about the LamCo-style heat pump was that every component but one was a standard refrigeration and electrical component. The only "exotic" piece of that heat pump was the evaporator panel. That panel presented a serious problem to anybody who tried getting into the business, however. The panels were not difficult to make, but not many places had the facilities to fabricate them. Huge industrial presses made the panels, and nobody could order eight panels from them to make one LamCo-style heat pump. The facilities with industrial presses only made the panels in lots of 1000, so somebody had to buy panels for 125 systems, or none at all. It was an economy-of-scale factor that doomed small operations. That was another reason why only Dennis was successful in the business. That industry Dennis dreamed of could only be created by selling, making and installing those heat pumps by the hundred.

Another problem Dennis had to constantly fight was what engineers and refrigeration mechanics thought they knew. A young engineer was in charge of the manufacturing facility that the Seattle "LamCo" bank had funded. The kid was about my age, was building them from the worthless patent of ten years earlier, and was referring to his refrigeration textbooks to guide him. It was a path to disaster. When Dennis began making the Big Time, he hired the kid, but had to continually correct what he was doing, because Mr. Young Engineer could not think past his textbooks. For instance, the LamCo-style heat pump operated at much higher pressures than typical refrigeration applications, which was also partly why it got much higher COPs than typical heat pumps. Mr. Young Engineer however, believed that his mission in life was making sure that no component would fail for twenty years on the LamCo-style heat pump. Consequently, he designed the system Dennis had built in his factory to choke down the pressures coming to the refrigerant pump from the panels. Choking down the pressures would ease the strain on the "compressor," but would also kill the heat pump's efficiency. It could turn a COP of six into a COP of two. Instead of saving the homeowner 85%, it would only save 50%, and instead of saving the customer \$20,000, would only save perhaps \$11,000 (in Washington, and far less elsewhere, where it competed against fossil fuels). Nobody would pay \$10,000 (or \$6000, after the tax credit was considered) for a piece of equipment that would only save \$11,000 over many years. The customer might as well buy a gas furnace under those conditions. Under the conditions Dennis had already seen the heat pump operate under, a refrigerant pump in a LamCo-style heat pump needed to be replaced every seven years or so, but would only cost \$300 (with more engineering, specifically designed for that application, those pumps could probably have lasted twenty). Mr. Young Engineer would gladly sacrifice \$9000 in energy savings to save \$300 in replacing the heat pump. That was the kind of shortsightedness that Dennis was always fighting with his technical people.

Another example of the limitations in the technical mind was the notion of 12,000 BTUs per hour that 4-horsepower systems could theoretically produce. Mr. Young Engineer read it in his refrigeration textbook, and it became his mantra. He tested a LamCo-style system, documenting 100,000 BTUs per hour with a four horsepower system, which was 25,000 BTUs per hour.[\[17\]](#) Even then, he still could not reject his knee-jerk notion that only 12,000 BTUs per hour was possible. He even testified to the 12,000 BTUs-per-hour notion at Dennis' preliminary hearing in late 1988, and then his report in his own hand was shown to him, and he hit his forehead, saying that he had forgotten that he had done it, but had to admit the "impossible" when faced with his own report.

The rumor campaign by the electric companies' "conservation" departments was doing a lot of damage. Customers who immediately signed up for the no-risk [SFS](#) offer got scared after hearing the slander concocted by the electric companies. Dennis gave a facility tour to his customers, and they became excited and realized that the electric companies were lying. Many of Dennis' customers had some illusions shattered, as they compared electric company propaganda to reality, but the tactics worked well enough to still scare off many customers, even after they had signed contracts.

The tax credit would not apply if those systems were not installed and running by the end of 1985. So, during the summer of 1985, Dennis geared up to make and install the systems himself. The manufacturer in California went out of business, and years later Dennis came into contact with the president of that failed company. That president told me that his company was wiped out, just as Dennis began needing systems made as fast as possible, by Chase Manhattan Bank, the [Rockefellers'](#) bank. They made a dirty play and wiped out Dennis' manufacturer, so Dennis had to make them himself. It is one of many times that the Rockefeller name has come up during the research for this site, including the [banking world](#). Maybe it was a coincidence, but eventually one wonders, when it happens "coincidentally," time after time.

The Attorney General's office began making its investigation officially known, not the bold-faced denials they earlier issued. In September, just as Mr. Financier committed \$10 million of financing to Dennis' company, and Dennis stock was worth \$50 million, Dennis was summoned to the Attorney General's office to make a deposition. There sat Hansel and Gretel with Ms. Deputy Attorney General, dropping their "cover" as college students. Hansel and Gretel acted like children, giggling with their all-knowing grins, and Dennis had to finally complain about their imbecilic behavior. By the questions they were asking, it became obvious that they were filling their slings with mud. Dennis did everything he could to cooperate with their "investigation," and his attorney told them they would cooperate in any way they could with the "investigation," as the company could ill afford any more bad publicity. It turned out that Ms. Deputy Attorney General was simply sharpening her ax, and waited until Dennis had his back turned.

By October, due to the climate of electric company rumormongering, banking relationships that evaporated overnight, libelous newspaper articles, the Attorney General's "investigation," and other unpleasantness, Dennis was thinking of relocating his business. The state of Indiana, suffering from the "Rust Belt" syndrome that had been plaguing the Midwest for years, was rolling out the red carpet, trying to lure Dennis' factory there. He went to meet with Indiana officials, but had his lawyer tell Ms. Deputy Attorney General that if she needed Dennis to hang around to assist her investigation, he would not take the trip to Indiana. Ms. Deputy Attorney General replied that her investigation was a formality, that everything looked fine, and that they could talk when Dennis came back from Indiana.[\[18\]](#)

Dennis went to Indiana to meet with the officials, and everything was going great, until Dennis' Indiana contact came to see him in a panic, and asked what was happening. Dennis' company was splashed all over the Seattle media. Dennis' wife came to the factory on the morning of October 9, to a parking lot full of TV camera crews and reporters. They asked her about the lawsuit that the Attorney General had filed against them, and her response was, "What lawsuit?" Ms. Deputy Attorney General had engineered a carefully planned media attack, when Dennis was out of state and unable to defend himself. Even though the media had splashed Dennis' company all over the airwaves, with one newspaper headline reading, "Attorney General Orders Company to Clean Up Act or Get Out of Town," in fact, no lawsuit had been filed. In a later situation, [I saw for myself](#) how media attacks could be used to wipe out companies. Two days later, the lawsuit was filed. The stock of Dennis' company plummeted in the wake of the media attack, and his stock lost \$30 million of value overnight. The so-called lawsuit had dozens of charges on it. Not one of them was legitimate. It was a string of rumors and lies. To demonstrate how legitimate the lawsuit was, one of its charges was that there was no manufacturing facility where the systems were being made. Guess where the lawsuit was finally served to Dennis' company? At the factory where the systems were being made. The Mafia acts with more integrity than Ms. Deputy Attorney General did then, and Dennis had experience with both.[\[19\]](#)

When a media attack is made that way, it does not matter if the Attorney General was making up everything from whole cloth, which was largely the case. Most people will flee when faced with such an assault. Every customer that had not put money down on the system immediately canceled his/her system order. About 400 customers had put down a deposit on the system, and those were the customers that did not flee. Those customers even signed a petition to ask the Attorney General's office to stop "protecting" them.

Dennis countered the Attorney General's media attack with a full-page ad that he wrote on the plane back from Indiana, and it ran in *The Seattle Times* on October 18, 1985.[\[20\]](#) Public protest buried the Attorney General in calls and letters, and it became one of the two biggest publicity black eyes that the Attorney General ever endured while trying to crush somebody.[\[21\]](#) Suddenly, Ms. Deputy Attorney General was eager to "settle" her so-called case with Dennis. Eventually, Dennis had his customers vote on whether he should settle their

fraudulent lawsuit, and they voted for him to, because they would all probably lose their deposit, as the company would be strangled if he did not. Dennis calls it the dirtiest deal he ever did, settling with those people. To this day, Dennis' detractors use that lawsuit's settlement as hard evidence that Dennis is a crook. [Mr. Deputy](#) even tried that angle on me on the day of his criminal raid, but when he realized that I knew what happened in Seattle, he stopped trying.

A media attack was merely one salvo of many. When the camera crews showed up in the parking lot, the [BPA hit man](#) made his move. He had worked less than ten weeks at Dennis' company, and instead of "smoothing" things out between Dennis and the electric companies, as he had solicited, he instead tried befriending all the key people at the company, and placing doubts in their heads whether Dennis was really fit to run his own company. Until the camera crews showed up in the parking lot, Dennis was flying very high. The BPA hit man then made his play, contacting every key person in the company that morning, trying to incite a mutiny. His plan was for Dennis to come back from Indiana to a company in ruins. It was not a smart move, as the company was in good shape and everybody could see that Dennis was what made it happen. Nobody who mattered was really convinced by Mr. Hit Man's play, and when Dennis came back, Mr. Hit Man was sent home, with pay, to stop trying to incite mutiny. Mr. Hit Man then waged a [several-month-long vendetta](#) against Dennis' company, which resulted in the [death of one of Dennis' employees](#) before the year was finished.

The attack by Mr. Hit Man was carefully coordinated with the Attorney General's office, as he was seen with Ms. Deputy Attorney General on more than one occasion. When asked about it, Ms. Deputy Attorney General said she had never heard of the man. Nearly everything that came out of her mouth in those days was a lie. Much later, after she quit her job, she would admit to Dennis that she was merely "[following orders](#)" as she tried destroying his company. That was also Eichmann's defense.

Through great heroism, Dennis' company survived the onslaught long enough to install those 400 systems by the end of 1985. After that, however, the media and Attorney General attacks, combined with the [phony bankruptcy suit](#) that Mr. Hit Man had waged, strangled the company in early 1986, [about the time I came to Dennis' company](#). Because of what had happened, the systems installed in late 1985 did not work well, nearly thrown on the homes to qualify for the tax credit that expired on December 31, some with only one panel. Mr. Financier was going to be ruined if those systems did not save the customer money in reduced energy bills.

When Mr. Hit Man [caused the death of Dennis' employee](#), Dennis came to a new level of inspiration. Even though the electric companies, BPA, Attorney General and others acted with great cowardice, siccing sociopaths and toadies such as Mr. Hit Man, Ms. Deputy Attorney General, the media and courts on him, Dennis finally figured out who was behind the attacks. He then declared war on the electric companies, sending them letters, telling them that they

had drawn first blood. [The day I met Dennis](#), March 18, 1986, he hired me on the spot, and that night he announced project W.P.P.E.E. at the Seattle Center.[\[22\]](#) I attended that show, and saw my future. The lightning bolt hit me pretty hard when I interviewed with Dennis' company, and I was going to be able to chase my free energy dreams from my childhood.

Over the years, countless people have blamed Dennis for what happened in Seattle, or used it to call him a crook. None of the charges have ever held water. I do not have the emotional reserves to go into chapter and verse of what Mr. Hit Man, Ms. Deputy Attorney General and their pals did. Dennis' *My Quest* and *The Alternative* do a creditable job of it. *My Quest* is an amazing document, written from Dennis' jail cell, and he did not expect to live to see this side of the bars when he wrote it. [Killing one of Dennis' employees](#) did not even slow down Mr. Hit Man. After he helped wipe out Dennis' company, he changed costumes and cultivated a reputation for being a [Tesla researcher](#). He was a wolf in sheep's clothing in the alternative energy crowd; the sheep had no idea that the [wolf was in their midst](#). How many like him are in the ranks of such organizations?

While Mr. Hit Man worked his evil, others were at it too. Ms. Deputy Attorney General essentially took Dennis' customers and Mr. Financier hostage. The entire [crux of her case](#) was that *one* person in Washington innocently misunderstood *one* thing Dennis said. That was the "crime." The Washington settlement and the plea bargain Dennis did in Ventura were due to the prosecutors taking innocents as hostage to compel Dennis to settle. They were both for civil law "violations," not criminal law, and Dennis still spent two years behind bars, while many lives were wrecked.

While the Seattle company was being bludgeoned by the Big Boys, some of Dennis' dealers made their play to steal customers, employees and the like. One was named Reggie; another was Terry. Dennis was desperately trying to keep the company alive. Employees betrayed the company, becoming spies for the crooks, etc. I was so on fire that I worked for months for free during that spring. Then in June, my boss, the controller, helped engineer the theft of Dennis' company out from under him. Once again, Dennis was screwed by a stock deal. The controller was entrusted to take care of the stock deal when Dennis bought the shell company, to ensure the deal was consummated properly. That was partly why he was hired. He instead used his position to steal the company. Dennis' company was stolen mere weeks after Mr. Financier's company was stolen, by some of the same people who stole Dennis' company. Mr. Financier thought that the thefts of both companies were related.[\[23\]](#)

When I joined Dennis' company, I had just left Los Angeles due to a [paranormal experience](#), and began realizing that [my profession was worthless](#). I went through a disillusionment process that lasted for several years. It was a gradual process, with salient events punctuating it periodically. The first one I got with Dennis happened when his company was stolen. Up until then, I was as excited as I have ever been, and felt that people who truly cared about

what Dennis was doing surrounded me. During those early days, what impressed me was Dennis' integrity in the face of adversity. It was a rough ride, working without pay, as the company was dying. I thought that those still there were trying to keep the vision alive.

Dennis' company was stolen in a shareholders' meeting. When the meeting began, it was uncertain who would prevail, Dennis or the thieves. There were scores of employees there that night, some who had left the company while I was there, and others I had never seen before. Dennis had a few hundred employees during the previous December, as they rushed to get those systems installed. As the night wore on, it became evident that the thieves would prevail. Some threw their lot in with the thieves from the beginning, while most began neutrally. There were about a dozen who were openly behind Dennis. When it became evident that the thieves would prevail, there was a moment when the thieves' ringleader took the podium, and said that nobody wanted Dennis around anymore. A cheer went up from the crowd. I looked out across the room, and people who I worked alongside, who gave Dennis standing ovations in meetings I had attended, were now cheering the thieves. When the crowd yelled, "Give us Barabbas!" it probably looked something like that. All those employees were really loyal to their paychecks, and if a thief appeared and put a dagger in Dennis' back, well, that was OK, as long as the paychecks kept coming. Those who cheered those thieves inherited the wind.

Dennis met the next day with the dozen "loyalists," and he left the state within days, trying to rebuild his company with some of his dealers. His wife left a few days later, to be with him. We sat in Seattle, waiting for Dennis to make something happen. One-by-one, the loyalists fell by the wayside. I sympathized with those who bowed out to feed their families. It was July, and we had enjoyed one paycheck since March. I used up my savings during those months, and eventually had to move back in with my grandparents. A few bowed out with honor, although some did not. There was another salient event that happened to me during that summer, which helped me eventually figure it out. It is discussed at this footnote.[\[24\]](#)

The Pursuit of Free Energy

By August 1986, I was the only one left from the Seattle company who still wanted to work with Dennis. One engineer built Dennis' Seattle factory, and he used to be the plant superintendent for Boeing's 747 manufacturing plant in Everett, which is the world's largest building. Mr. Engineer waited for Dennis to come up with money to pay him. He had bladder cancer, and when he got it, Boeing eased him into retirement. He was in his late 60s and virtually unemployable. I was a young buck in my 20s, and in August I told Dennis, who by that time had moved to Boston to try rebuilding, that I would sleep on a floor to try rebuilding what he was doing. Dennis originally tried dissuading me from moving out there, but when I proved persistent, he told me to come on out.

[I moved to Boston in November 1986](#). When Dennis announced Project W.P.P.E.E., he had no idea how he was going to make electricity and compete with the electric companies. Dennis and his family moved to Boston with little more than the clothes on their backs, once again. From a \$50 million net worth to nothing in less than a year...that was the kind of life that Dennis and his family led. Their few possessions were stored in that beat-up station wagon that Dennis drove into Seattle over the mountains in 1984. It was stored in Mr. Engineer's barn in Ellensburg, and I made a couple of trips over the mountains, loaded their stuff into a trailer, with some of my possessions, and towed it behind my 1973 Pinto to Boston.

Many lives were shattered by the Seattle events, as the electric companies wiped out the competition. One who suffered badly was [Mr. Inventor](#). He had a heat storage technology that Dennis was promoting, and he had a facility at Dennis' factory. Knowing what might happen, just before the thieves stole the company, several of us rented a truck and moved as much of Mr. Inventor's equipment to Mr. Engineer's barn in Ellensburg as we could. It was horrible what the thieves did, and Mr. Inventor suffered. Unfortunately, Mr. Inventor began blaming Dennis for what happened, which was ludicrous, but is a typical reaction. Mr. Inventor was going to make *somebody* pay for what he suffered through, even if it was his best ally.

Before I moved to Boston, I helped Mr. Inventor as much as I could, and we met several times. One night, he told me about the inventors' clubs that he belonged to over the years. He found that no inventor would support another in getting his invention out there. It was like a pack of dogs, each trying to be the alpha dog. He said that those inventors' groups were doomed because of the inventors' selfish natures. Up until that time, my exposure to inventing was [Mr. Mentor](#), and I never heard that kind of talk from him, but would instead hear how all his stuff was stolen or suppressed, and how all he wanted to do was help the world. My early exposure to inventing misdirected me. Thirty years later, Mr. Mentor is the closest thing I have seen to an altruistic inventor, and that early exposure misled me about how most of them act. What Mr. Inventor told me was not forgotten, and it lay in the back of my mind for years. The last delusion I shed (not completely shed until about ten years after Mr. Inventor told me that story) was that inventors, with their creative talent, somehow had a higher level of integrity than the average population. By 1997, I ruefully realized that that was not true. Creative talent does not confer integrity. Mr. Inventor was ironically the first one to begin demonstrating that fact to me.

A couple of days before I arrived in Boston, Dennis got his WPPEE lightning bolt. When Dennis arrived in Boston, just like he did in Seattle, he tried working *with* the electric companies and energy establishment. People like Dennis never begin as rebels, but as believers in the system. Only after they are repeatedly crucified do they begin getting "political" and "rebellious," because they have seen first-hand, and born the brunt of, how corrupt the system is. [Ralph McGehee](#) and [Rodney Stich](#) are similar, [as was I](#). Dennis spoke at a Department of Energy hearing, and in the audience was a man who worked at a company that used a 200° F heat source to generate electricity. The exhaust temperature of the LamCo-

style heat pump was about the same temperature. On Monday, the day after I got to Boston, Dennis and I drove to that company and visited with its president. We watched their turbine making electricity from that low-temperature heat source. It was then that Dennis began making his “free energy” noise. Dennis’ original idea was marrying his heat pump to that low-temperature heat engine to make free electricity. He called his idea “Low Temperature Phase Change.” At that time, Dennis knew nearly nothing about thermodynamics and had never heard of [Carnot](#), but he put on his P.T. Barnum hat. Before long, we were preparing to put on “The Greatest Energy Show on Earth.” Below is an image from our first show. Those were happy and innocent days for me.

Click on image to enlarge

Dennis *is* an evangelical P.T. Barnum, but that is not what he is *all* about. He does the P.T. Barnum stuff partly because it works (although it is a double-edged sword, making many uneasy), but also partly due to his migrant farm worker, *Grapes of Wrath* background. About my life’s happiest year was 1986, although I made almost no money that year. I was chasing a childhood dream that could have been immensely valuable for humanity. I ended that year doing a 45-day fast, partly because it was cheaper than eating. During 1986, my yuppie habits were beat out of me, as it got down to survival. I got to where I could live on about \$50 per week. It was a minor hardship, however, when compared to the thrill of chasing that dream.

In Boston, my life changed. I lived with Dennis and his family for about a year. Dennis and I had long talks into the night. Those days are covered [elsewhere](#), and Dennis covers them in his books. There was more betrayal and egos-in-charge in Boston, and just when it looked grim, I raised money to get us going again. I had a lot of innocence and naïveté to still lose, and within two years of raising that money, my life was shattered. In those early days in Boston, however, I was full of fire, had fully recovered from the stress of my LA days, and began working 70 hour weeks again, helping to get W.P.P.E.E. off the ground. Early on, as Dennis began making his free energy noise, I brought in my long-retired [mentor](#) to look at what we were doing. Were we chasing an impossible pipe dream? His response was that although classical thermodynamics said what we were trying to do was “impossible,” he was not so quick to call it impossible, and thought we had a chance, but not with Dennis’ turbine concept.

Mr. Mentor eventually gave Dennis his hydraulic heat engine design, with its pressure intensifier concept, to marry to Dennis' LamCo-style heat pump panels, and gave his opinion that free energy might be possible with that arrangement.

In Boston, although Dennis got the red carpet treatment from New England's most powerful electric executive, we experienced a media blackout and other fun. I tied into talent and money with Mr. Professor and others in my hometown of Ventura, and we moved there in the summer of 1987. In late 1987, Dennis found the program that worked, and the rocket ship that he built in Seattle [was taking off once more](#). We were building a prototype of Mr. Mentor's hydraulic heat engine, to try developing a free energy machine. On New Year's Day, 1988, we became involved with another hydraulic heat engine, invented by Victor Fischer. Unlike Mr. Mentor's idea, Fischer had already built and run his hydraulic heat engines, in Australia, spending millions of dollars in development. Fischer's and Mr. Mentor's hydraulic heat engines were similar in concept, and Fischer's had already been built, so we abandoned Mr. Mentor's idea to try building one of Fischer's engines on a scale small enough to power a home. It is incredible that both hydraulic heat engines came to Dennis a few months apart.

When Mr. Mentor [invented his engine at a stoplight](#), he was not trying to make a free energy machine or defeat the second law of thermodynamics. He was just designing the best engine for powering a car. Fischer, however, was taking on Carnot head on. About the only "inside" information I have about Fischer's engine was hearing him talk about it for about five minutes, soon after he came aboard in Ventura. He said that in Carnot's seminal work, he *assumed* an ideal gas in his ideal heat engine. Carnot then extrapolated his logic with his ideal gas heat engine to cover all heat engines, and Fischer said that that was where [Carnot](#) made his fatal error, and that liquid heat engines were ignored ever since. It harkens back to the notion that Carnot's theory may have owed the steam engine more than the steam engine owed thermodynamics. Fischer's hydraulic heat engine challenged Carnot's *assumption*, and also the classical interpretation of the second law of thermodynamics. Fischer thought, like Mr. Mentor did, that a hydraulic heat engine, combined with Dennis' LamCo-style panels, might have a chance at making free energy. It was not something that Dennis dreamed up. Fischer and Mr. Mentor are technical and scientific heavyweights, not fast-talking promoters. Fischer helped write thermodynamics textbooks, and he said that thermodynamics textbooks are, in large measure, expedient rubbish. What Fischer said sounded a lot like describing the expedient fairy tales that students are given by microbiology textbooks regarding [Pasteur and the spontaneous generation theory](#). The data from Fischer's first prototype had it coming closer to Carnot's ideal than any other heat engine ever had.

The main issue was that in Fischer's engine, only a percent or two of the working fluid ever became a gas, so far less entropy was created in the process, which made the efficiency rise dramatically. With both Fischer's and Mr. Mentor's engines, they *do not need cooled condensers*, which was what [Watt's engine](#) was all about. That is a formidable mindbender for physicists and engineers to ponder. No more bodies of water would need to be heated up to

cool down working fluids, as well as many subtle advantages. It is a radical new direction in heat engine technology, which could spell the end of the many environmentally destructive methods of today's heat engines.

Even if hydraulic heat engines could not provide free energy, it would be the first new heat engine cycle in a century, and could possibly sweep aside nearly all the others. Even without free energy, its potential is countless billions of dollars, and a great reduction in environmental harm.

Two days after Dennis publicly announced that Fischer had come aboard, and we were going to try making a free energy machine with his engine, [we were raided](#). Below are some images from the raid.

Click on image to enlarge

I watched them kick in Mr. Engineer's door. Mr. Researcher *watched them* ransack and clean out his office, and photograph the prototype blueprints while rolling them out on his desk. The Ventura County sheriff's department later denied doing it, even when they knew we saw them doing it.

When I moved to Boston and Dennis got his free energy vision, he had me contact Mr. Inventor and try to get him on board, and allow Dennis to promote his heat-storage technology. I had a dismaying conversation with Mr. Inventor. He blamed Dennis for what happened in Seattle, and said that unless Dennis gave him a lot of money, he would not work with him. In a candid moment in Seattle, Mr. Inventor admitted that he was probably too greedy for his own good, and he would probably hurt Dennis and himself with his greed. He was prophetic.

When we began flying high in Ventura, Dennis contacted his best salesman from the Seattle days, asking him if he wanted to come onboard and begin making the big money again. Dennis flew him and Mr. Inventor to Ventura. A few of those "loyalists" that fell by the wayside in 1986 banded together around Mr. Inventor. As Dennis showed his salesman and Mr. Inventor that he was rebuilding and going for the Big Time again, they declined to get involved. Just before the raid, we discovered their game plan. We received an extortion

demand from Mr. Inventor, that salesman, that [Mr. Young Engineer](#) and his installer sidekick for about \$250,000. The rationale was that Dennis was supposed to be paying Mr. Inventor thousands of dollars a week since Dennis' company was stolen, along with another \$100,000 thrown on top, and Mr. Inventor demanded it. Dennis was trying to recruit Mr. Inventor almost as a favor to him, to help heal what had happened in Seattle. With Mr. Mentor's and Fischer's stuff on the front burner, heat storage technology was kind of passé to us. For Dennis trying to act honorably, he received an extortion demand.

Soon after the extortion demand came the [raid](#). For me, it began going downhill rapidly. The year before, soon after I raised the money and began working 70-hour weeks, my stress symptoms from my [LA days](#) came back in full blossom. After the raid, I began looking like a raccoon again, with dark circles around my eyes. I had to work fifteen-hour days just to survive, with all our records seized in the raid and my office stripped to the walls. People have told me that I looked at least ten years older than I was, during those days. I wish that were the only toll. Family and friends disowned me, few of them having a glimmer about why I was with Dennis and what we were trying to do, nor seeming to want to know. In their eyes, I was either trying to get rich quick, under the spell of a con man, we were both deluded fools, or I was a crook myself. The personal devastation I endured during those days was far worse than getting the ax from the Big Boys. Going bankrupt was the *least* of my troubles in 1988.

By the spring of 1988 I was a pile of wrecked nerves, and I asked Dennis if I could take the summer off to try recovering. Dennis then got the [billion-dollar offer from the Big Boys](#). When he refused it, he was arrested the next month [on a million dollar bail](#). I was hiking in the Cascade Mountains in Washington as Dennis rotted in jail, and another apparent provocateur, from Texas, made his move. [Mr. Texas](#) made his play immediately after Dennis was arrested. In the wake of the deathblow aimed at us with the raid, Dennis tried getting the Ventura operation superfluous to the movement's success, and he recruited ten dealers to become regional directors for a national operation. The slickest presentation was Mr. Texas'. He also immediately initiated the same kinds of low-level political maneuvering amongst the dealers that [Mr. Hit Man](#) did with Dennis' Seattle employees. Dennis saw him doing it and suspected what he was up to, but I did not know about it, partly because I had largely left the operation by the spring of 1988.

Mr. Texas recruited some dupes to help him make his play. One was Mr. Stooge, who worked with his wife for us in Ventura. He became involved in Boston. Mr. Stooge wanted to replace me as Dennis' protégé, and Dennis told him that he doubted he had the integrity to be that. Dennis was prophetic. Mr. Texas made his move as soon as Dennis was jailed, and Mr. Stooge and another dealer joined with him, and they became known as The Trio. While Dennis' wife was desperately trying to raise the million dollar bail, Mr. Texas was making his play, dominating the other regional directors and dealers, getting quite a few to back him, while the others mostly faded to the sidelines, not knowing what to do.

The Trio went to Ventura and went to work, working closely with Mr. Deputy to shut down the Ventura operation. Mr. Texas threatened and lied to those who put up their homes and assets to try raising Dennis' bail. His intimidation tactics and lies worked. One of Dennis' first dealers in Ventura bought a LamCo-style system and installed it on his greenhouse facility at his ranch, which was only a 20-minute drive from our Ventura office. It was a beautiful installation, which the rancher and his son installed, and it saved him about \$500 per month. He posted up his \$600,000 ranch as bail collateral for Dennis. Mr. Texas told him he would lose his ranch if Dennis were found guilty. That was in the Big Lie category, but it worked, and the rancher pulled his ranch from bail consideration.[\[25\]](#) Mr. Texas used whatever intimidation and lies he could produce, to chase away anybody who might support Dennis. I was hiking while that was happening. My future wife said she missed me, when I talked to her between hiking trips, and in July 1988 I went back to Ventura.

As I rolled into Ventura, I thought I would drop by the office before I went home. I was surprised to find the parking lot nearly empty, and the office closed. Standing in front of the building were Mr. Engineer, Mr. Texas and Mr. Stooge. They walked up to me and shook my hand, with Mr. Texas and Mr. Stooge looking a little sheepish. I had no idea what was happening, and it was another salient moment. Dennis picked Mr. Engineer off the scrap heap in Yakima, and Mr. Engineer saw what happened in Seattle. Mr. Engineer would later admit to me how naïve he was, and that moment in front of the empty offices he proved how deeply his naïveté went, and probably his integrity. At that time, I had no idea what Mr. Texas and Mr. Stooge had been doing, but a few minutes before I drove up, Mr. Texas walked through our buildings, telling all the employees that he had just come from meeting with Mr. Deputy, and that anybody who continued working at our company would be arrested as Dennis' accomplices. All the employees ran out of the building, and many also stole anything that was not nailed down on their way out. I thought I had seen [ugliness in Seattle](#). What happened in Ventura made the Seattle events pale to insignificance.

As I shook their hands, Mr. Engineer told me that he and Mr. Researcher were going to go to work for Mr. Texas and Mr. Stooge. It smelled familiar. I left the empty office and called a shaken up [Mr. Professor](#), who told me what was happening. Mr. Texas had used his arts of enticement and intimidation on Mr. Professor, and he was no longer sure if Dennis was a "good guy." I told him what I thought was going on, which turned out to be correct.

Today, it looks like Mr. Texas was a free-lance crook, not a paid provocateur, as he was [arrested in a religious scam in 2003](#). The sad part was not the move Mr. Texas made, but that so many easily played into his hands; Mr. Stooge, Mr. Engineer and Mr. Researcher among them. Mr. Texas played the "[fake angel](#)" role, and it easily worked.[\[26\]](#)

Mr. Professor and I were about the only two people who helped Dennis in Ventura, besides Dennis' wife. I was a young buck, but Mr. Professor was a pillar of the community, about the most revered at the local college, and the best professor I ever had. We both had the most

dismaying experiences of our lives in those days.

Anybody who played ball with Mr. Texas would get a dagger in his/her back or chest eventually. Mr. Researcher scoffed at my warnings about Mr. Texas and friends. He made Dennis out to be a bad guy in his mind, so he could justify abandoning him. Mr. Engineer had a roll of ARL (a competitor of Underwriter Laboratories - UL) labels that were from the Seattle factory days, that they put on the Seattle systems. It became potentially valuable (not really, if one knew much about how it worked, as the labels were also specific to where the equipment was made), and Mr. Texas lured Mr. Engineer to Texas to come work for him, with the promise of a paycheck. Mr. Engineer drove out there. Mr. Texas used Mr. Engineer's relationship with Mr. Stooze to wrangle those ARL stickers away from him. About five minutes after Mr. Engineer parted with those stickers, Mr. Texas fired him, and Mr. Engineer drove all the way back home, penniless, to Ellensburg.

When The Trio made their move, Dennis and his wife even offered to let them take the company, but they would have to take it as only three of the ten regional dealers that Dennis had (i.e., the thieves could only own 30% of what they stole, not 100%). They rejected that offer and went for it all. The day I showed up, Dennis' wife was desperately trying to hold it together in the face of the hurricane. She allowed my credit card that I lent the company to reach a \$25,000 unpaid balance, which eventually bankrupted me, so she could keep the employees paid and hold the doors open another week. When Mr. Texas made his play, the forty employees were owed about a week's wages. The cameraman, who serendipitously was on hand when the raid happened and filmed part of it, was asked to leave the company when Dennis was arrested, because there was nothing for him to do. He refused to leave, and when Mr. Texas closed the business' doors, the cameraman stole \$6,000 of professional camera equipment to collect his "pay." The machinist sold off the machine shop equipment for \$5,000, pocketed the cash, and left town.

Dennis' wife was trying to give the company away to anybody who could keep it alive. A Colorado billionaire was interested, and Dennis' wife and Dennis' most loyal salesman (an ex-minister) flew to Colorado to meet with him. Mr. Texas stalked their every step, found out their plans, and called the billionaire, spewing threats and lies. The day after I showed up in Ventura, Dennis' wife flew to Colorado to give the company away to the billionaire. She wanted me to hold down the fort at the empty office. She was racing between our facilities (two office buildings, and a machine shop we had recently moved to another building in town), trying to hold it together. I sat in Dennis' office, waiting for her to show up to show me what I needed to do. She drove up, to race in, get something she needed, and race out. She parked the car right outside Dennis' office. In her haste, she left her keys in the ignition. On her key ring were her house keys and keys to our buildings. As I looked out the window, a car raced up behind her parked van, and out of the car leapt a man who we were training to be an installer. He stole her keys and drove off. He ransomed her keys for the few days of wages owed him, which amounted to five hundred dollars.

That was not the only problem with keys that she had. A woman worked with us in customer service the previous winter, and she left the company to move to Montana. Her adventure did not work out too well, and she came to our company that spring, asking us to hire her back. She also asked us to hire her boyfriend. We did, and he ran the customer service department, and he had keys to our buildings. When Mr. Texas closed the company's doors, Dennis' wife asked the man to give his keys back. He refused to do so, I suppose because he was also owed a week of wages. That evening, Dennis' wife showed me some work she wanted me to do on the computers. They had several Macintosh computers in the offices. Then she got on a plane with Dennis' salesman. The next day, I went to the office to do the work Dennis' wife instructed me to do. Our facilities were pretty large, and I went to the room where the computer was supposed to be, and it was not there. I had just turned thirty, was gradually recovering from the stress of the previous spring, in spite of what was going on, but I thought that I had become a little forgetful. I began walking through the buildings, looking for the computer I knew Dennis' wife had shown me the day before. I became increasingly bewildered, wandering around the buildings. I could not find *any* computers!

When Dennis' wife got back from Colorado, I apologized and told her that I could not find the computers, so I could not perform the work. Perhaps she took them and forgot to tell me. She quickly found out what happened. That woman and her boyfriend, like everybody else, had already judged Dennis and his wife, concluding that we were crooks, and they used the keys they refused to hand over to enter our buildings the night Dennis' wife flew to Colorado. Like everybody else, they were owed a week of wages, so they would collect their pay by stealing everything they could. They took all of our Macintosh computers that night, and they also stole office equipment we had been renting, and was not even ours. Then they put the icing on the cake. Although they had just proven themselves criminals, they were going to help Mr. Deputy bury Dennis. They stole all the customer service files and delivered them to Mr. Deputy, as "evidence" against Dennis. Mr. Deputy gladly received the stolen files, and it became a large portion of their 10,000 pages of discovery evidence for Dennis' trial.

Those were far from the only instances of Dennis' employees and dealers "getting theirs" as the company was killed. I witnessed about twenty attempts, during my years with Dennis, to steal his company. Some were pathetically funny, as greed-blinded, toothless piranhas made their plays. What Mr. Texas did, however, hurt. After I had seen Dennis' "buddies" try stealing his companies and committing other crimes several times, I told Dennis how shocking it was to see, and he responded with, "Yes, the first fifty times they did it, I was shocked too." Also, it was always "nice guys" who did it. Dennis says, "I've never been had by a man I didn't like."[\[27\]](#) They always show up with a friendly demeanor, otherwise they can never get close enough to jam their knife in his ribs.

While Mr. Hit Man merely abandoned his dupes to their fate when Dennis was taken out of the picture, Mr. Texas was not quite as gentle. When the Ventura company was completely destroyed and Dennis rotted behind bars, and it looked like he might never live to see freedom

again, Mr. Texas took off his mask and jammed his dagger into all those fools who supported his power play, including the other members of The Trio. When he did that, it seemed as if he was being paid. He put a lot of extra effort into screwing over anybody who was involved with Dennis' venture. Maybe the energy gangsters wanted to do it right that time, and not let Dennis live to try it again.

When [Mr. Deputy made faces](#) at me as I testified, it led to my final salient moment during my days with Dennis. [I then mortgaged my life](#) to try getting Dennis out of jail, a quixotic gesture that worked. Mr. Deputy was actively and consciously engaged in evil, and consequently has had a highly successful career in Ventura County law enforcement. Evil-minded people do well in evil systems. Up until that moment in the courtroom, I made excuses in my mind for his behavior. I never wanted to believe that people could be evil-minded, but Mr. Deputy finally rubbed my face in it that day. It was a turning point in my life.

When Dennis got out of prison in the mid-1990s, he went right back at trying to make a free energy machine using hydraulic heat engines, and was involved again with Fischer in the late 1990s. I could only stand back in awe, as I watched Dennis twice take his prison clothing off and immediately go for it again.

When I left home at age 21, I held the notion that perhaps one out of three people had enough integrity to do the right thing, even if their "reward" for doing so was not immediate or obvious. By the time I left college, that number had slipped to about one-in-five. My brutal years in Los Angeles, with me asking "[Easter Bunny](#)" questions that everybody laughed at, brought that number down to one-in-ten. The night when I watched those [Seattle employees cheer the thieves](#), I began waking up quickly, and thought it might be one-in-fifty by the time that summer was finished. When I saw the general apathy to what we were trying to [do in Boston](#), and began receiving personal attacks, my number slipped to one in a hundred. When I saw what happened in [Ventura](#), with us having a national profile, with people I had known most of my life acting dishonorably, and being attacked by friends and family, I finally came to realize that the number was one in thousands. That was the biggest and most painful surprise of my journey: personal integrity is the world's scarcest commodity.

That level of personal integrity, or lack thereof, I have now seen in other professions and industries. [Ralph McGehee](#) is one of only two CIA employees who ever figured out what the CIA was really all about and "legally" published their findings. What made Ralph unusual was not his considerable intelligence; it was his integrity. It was not until 1995 that somebody from the FBI did what Ralph did, and there was at least one offer by a policeman to murder the man before his book was published.[\[28\]](#) Similarly, only one in thousands of American medical doctors has the integrity to [realize and admit that orthodox cancer treatment does not work](#), and the courage to pursue and provide an actual cure. Many other examples can be provided.[\[29\]](#)

The energy gangsters do not have to work that hard to derail people like Dennis. They simply get him in a headlock, then watch his “friends” disembowel him, and let our rapacious system simply grind away, with its [zero-integrity members](#). The reason we do not have free energy, [cancer cures](#) and the like is because not enough people care enough. It is that simple.

Footnotes

[1] Much of this narrative can be found in Dennis’ writings, particularly *My Quest* and *The Alternative*. Both were largely written from his jail and prison cells, and can be purchased from his company. As of September 2005, his company address was United Community Services of America, 3002 Rt. 23 North, Newfoundland, NJ 07435.

[2] See Dennis Lee, *My Quest*, pp. 1-2.

[3] See Gatto, *Dumbing us Down*.

[4] See Stuart Ewen’s *PR!, A Social History of Spin*, pp. 3-18. See also Herman and Chomsky, *Manufacturing Consent*, and Chomsky, *Necessary Illusions*.

[5] The “kill ratio” is how a prosecutor’s effectiveness is measured. It is measured as the number of convictions divided by the number of prosecutions. I have seen some very cynical prosecutors in my day, even friends. More often than Americans want to admit, prosecutors abandon the principles of fair play and justice, and a prosecution investigator even admitted to us that he could not care less whether Dennis Lee was guilty of a crime. [Convictions were all he cared about](#). He also [admitted to lying](#) if it would gain him his coveted conviction.

[6] Richard Bach has written several mystical books, and *Jonathan Livingston Seagull* and *Illusions* may rank among the best mystical books ever written. For years though, Bach did not feel he was the author of *Jonathan Livingston Seagull*. The book *Jonathan Livingston Seagull* came to him one night in 1959. He was walking along a canal when he heard a voice say “Jonathan Livingston Seagull.” Then he went home, and the book came to him in a flood of images. He tried assembling the jumble of images into a manuscript and was unable to finish it. Eight years later he heard the voice again, and it finished dictating the book. I have also heard that it was not until Bach took [Silva Mind Control](#) that the rest of the book came to him. It can be a small mystical world sometimes, and in Bach’s circle of friends were Jane Roberts and her husband. When the Seth material began being published, Bach saw the similarities in what happened to him and what Jane Roberts was doing in channeling Seth. He visited Roberts and her husband and attended Seth channeling sessions. In a session that became part of the *Nature of Personal Reality*, Seth told Bach that although he did not feel that he authored *Jonathan Livingston Seagull*, he indeed was its author. In 1972, Jane/Seth told Bach:

"Information does not exist by itself. Connected with it is the consciousness of all those who understand it, perceive it or originate it. So there are not records in terms of objective, for ever-available banks of information into which you tune. Instead, the consciousness that held, or holds, or will hold the information attracts it like a magnet...The information itself wants to move toward consciousness. It is not dead or inert. It is not something you grab for, it is also something that wants to be grabbed, and so it gravitates to those who seek it.

"Your consciousness attracts the consciousness that is already connected with the material. That is one of my goodies for the evening! Information, then, becomes new and is reborn as it is interpreted through a new consciousness, as *Seagull* was.

"The inner portion of your being, using those abilities that have always been yours, interpreted the information through the kaleidoscope of your own being, using the best portions of yourself - producing, then, a brilliant truth in new clothes - but in clothes that no one could have given it but yourself. Now I will tell you: If you assign the authorship of *Seagull* to another, then you deny the uniqueness of your own inner self.

"The truth came to you and was given to you, but the originality and uniqueness was provided by your own inner being, which may now be so separated from your conscious self that it seems to be apart from it.

"So other things were also involved - not only the birth of a book, but the emergence of the inner self, through art, into the physical universe. Now part of the focus and the strength comes from those two births, and the intensity behind them is also the reason why the book's nativity strikes the world as strongly as it does. The two are merged in the book. You are looking for the author of *Seagull*, and I tell you I am looking at him. He may not have the face that you see when you look in the mirror, simply because you cannot see your true identity in a mirror. But I am looking at all that is visible of the author of *Seagull*, and you should know him best of all. And I will tell you through the years how to become acquainted with him, and more on speaking terms." See Roberts, *The Nature of Personal Reality*, pp. 55-56.

[7] See Dennis Lee's *My Quest*, p. 32.

[8] There are many sources of this information. For instance, see David Shapiro's *Generating Failure*, pp. 32-33.

[9] A horsepower of pump power is also called a "ton" in the refrigeration business, related to the cooling capacity of a ton of ice, from the days before home refrigerators existed.

[10] During Dennis' Seattle days, he became involved with an inventor I will call Mr. Inventor. During the 1950s, Mr. Inventor worked for General Motors. For years, GM had him work in a special department. They gave him patents. They said they were their patents, which they were going to file for. His job was finding a way around the patents, so they could "bullet-proof" them, so others could not engineer their way around them. For several years he defeated patents, giving his findings to his supervisors. It was like hiring a burglar to break into your own building, so the security systems could be tested. After several years that work, Mr. Inventor discovered that those patents were not GM patents after all. They were patents of small inventors and GM's rivals, and he was helping GM engineer their way around those patents. He was the proverbial industrial burglar, not realizing that he was not testing the security systems, but committing real crimes at his employer's behest. The [American automobile industry](#) has long been expert at stealing inventions and shutting out inventors from getting anything from it, [power steering](#) and intermittent windshield wipers being two infamous examples. Mr. Inventor also told me that back during his GM days, there was a little "accident" in Detroit, where a man bought a pick-up truck and it got about 70 MPG. He told his friends and neighbors about that strange situation. Under the hood, it did not look too unusual, but his high MPG quickly came to the auto company's notice. They told him they accidentally let that experimental pick-up truck get to a showroom, where he bought it. They said the truck's valves would burn up if he kept driving it, and they offered him a hefty sum to buy their truck back. I had [heard about that kind of dynamic for a long time](#), and I got it straight from the GM guy who specialized in defeating patents. It is no urban legend.

[11] See, for instance the report issued by the U.S. Department of Energy, called the Energy Information Administration's *Annual Energy Review*.

[12] See Dennis Lee's *My Quest*, p. 105.

[13] A "shell corporation" is one with no assets, but has all the needed registrations and red tape completed, to act as a corporate vehicle for somebody that needs one quickly. They are legitimate and common vehicles for business ventures to use. Today, one can be bought for about \$100,000.

[14] See Dennis Lee's *The Alternative*, exhibit 1H.

[15] See Dennis Lee's *My Quest*, pp. 110-111.

[16] See Dennis Lee's *My Quest*, p. 116.

[17] See Mr. Young Engineer's report of August 14, 1985, titled "Performance Test," where he documented a COP of nearly 7, with more than 100,000 BTUs per hour, in the documents reproduced at the back of Dennis Lee's *My Quest*.

[18] See Dennis Lee's *My Quest*, p. 119.

[19] Whenever this story is told, and I have told parts of it many times, more than 90% of Americans respond with something like, “Hey, he must have been doing something wrong. Nobody gets that kind of attention unless they are hurting somebody. Some of those charges must have been legitimate.” That response harkens back to [my spiritual understanding](#). Most people have given their power away to anything and everything, as they refuse to take responsibility for their lives, playing the victim game. Consequently, they do not want to believe they have given their power to an evil system, run by evil-minded people. That mindless defense of the system is what keeps pioneers such as Dennis at the margins. The same thing happens in [medicine](#), where all the cancer cures are suppressed, and the only legal “treatments” actually kill off the patients. With that kind of logic, Jesus, Gandhi and Martin Luther King, Jr. were crooks too, spending time behind bars because they tried helping people, to eventually be murdered.

[20] See Dennis Lee’s *The Alternative*, exhibit 1C.

[21] Characteristically, the other black eye he got was when he attempted to wipe out an activist who tried a cheap housing solution for homelessness in Seattle. The activist fought back, and a flyer campaign by the activist helped derail the Attorney General’s bid for governor in 1992. He barely lost.

[22] See Dennis Lee’s *The Alternative*, exhibit 1E. W.P.P.E.E. was pronounced “Whoopee” and it stood for Worldwide Privately Produced Electrical Energy. Those kinds of positive, silly acronyms say a lot about Dennis, in a very good way.

[23] See Dennis Lee’s *The Alternative*, exhibit 1J.

[24] When my controller-boss helped engineer the theft of Dennis’ company, I became a creditor of the stolen company, for a couple months of wages. The thieves looted Mr. Financier’s company, as well as anything they could scrape from the carcass of Dennis’. They really thought they could revive Dennis’ company in Seattle, and then sell his heat pump once again. It was another example of [mindless greed](#). My controller tried recruiting me to come work for the thieves, and he showed me some glossy PR stuff they had produced, to revive the company under a new name, SONOS.

Mere days after they stole Dennis’ company, they were in bankruptcy court, trying to get the [phony lawsuit](#) waged by Mr. Hit Man thrown out. I attended the hearings in downtown Seattle, with some of the other “loyalists.” I partly went to finally see [Mr. Hit Man](#) in the flesh, as I had heard so much about him. Like a smart hit man, his job was taking Dennis out of the picture, and when Dennis’ company was crushed, and stolen, and Dennis hurriedly left the state, Mr. Hit Man probably got a big bonus from the BPA, and moved to Florida, where he changed costumes and became a “[noted Tesla researcher](#).” When Mr. Hit Man concocted his phony lawsuit, probably assisted by Ms. Deputy Attorney General and friends, he had to round up some dupes to make his play, to give it at least the veneer of legitimacy. After months of campaigning, he eventually recruited some dupes at Dennis’ company, largely a greedy salesman and his wife, another salesman who may have been another electric company provocateur, and a mentally unbalanced Vietnam veteran who Dennis deceptively told Mr. Hit Man was his right-hand confidant. Mr. Vietnam and Mr. Hit Man became fast friends, and they

were the ones who drove that woman to [commit suicide](#). Those five were the minimum “creditors” required by law to wage an involuntary bankruptcy lawsuit.

Dennis will never know just how deeply it all went, but there was a lot more than met the eye in that bankruptcy courtroom. When Dennis was waging the battle against the phony lawsuit, somebody probably got to his highly regarded bankruptcy attorney, who suddenly could not utter a coherent sentence in the courtroom, as he “defended” Dennis. The same thing happened with Dennis’ [first attorney in Ventura](#). The judge was also probably influenced somehow, possibly by a straight bribe. With Dennis taken out of the picture, suddenly the judge saw the light, and he became skeptical of the claims made by the bankruptcy petitioners. Mr. Hit Man left the scene as fast as Dennis did, and he and his dupes had a “falling out.” They were left holding the bag, waging the lawsuit on their own. I doubt they ever figured out how they had been used, probably partly under the spell of mindless greed. Their so-called claims were laughable, without a shred of documentary support. Mr. Hit Man, who worked at Dennis’ company for about ten weeks, claimed that Dennis’ company owed him \$5000 in vacation pay. The claims by the other petitioners were even less substantial than his.

As I sat in the courtroom, listening to their senseless testimony about how Dennis’ company owed them so much money, the scene bordered on the surreal. The judge was probably working on the electric companies’ behalf, to even let such an obviously fraudulent lawsuit strangle Dennis’ company. Mr. Hit Man was on an evil mission, and had abandoned his dupes to their fate. My boss engineered the theft of Dennis’ company, while the new chairman of the board helped steal Dennis’ company as well as Mr. Financier’s. In the public seats were many people, including employees who wanted their back pay, and dealers like Reggie, who tried gutting Dennis’ company as it was dying. Reggie was rubbing his hands, hoping the company would be brought out of the phony bankruptcy so he could make a play of his own. There was a courtroom recess, and my controller-boss, his attorney and his group of thieves had a quick huddle, as they talked about strategy. Reggie eagerly left his seat in the audience and tried joining the huddle, and they turned on him, staring him down, asking him what the hell he thought he was doing. Reggie was excited and living in a delusional state, thinking that he was on the same team as the thieves, a notion they rudely disabused him of. When that day’s hearing was over, I said in awe to my “loyalist” friend, “It was like watching the sharks battle the piranha in there!” He noted that there were more than two groups making their plays in that courtroom, and it would have been more accurate to say it was the sharks versus the piranhas versus the barracudas versus the crocodiles. That day in that courtroom was one of my salient moments in my long process of disillusionment. The judge saw the light at last (wink, nudge). He not only threw out the bankruptcy case, he also recommended countersuing the pants off of those dupe petitioners.

[\[25\]](#) See Dennis Lee’s *The Alternative*, exhibit 3L.

[\[26\]](#) The fake angel dynamic is this: somebody shows up and announces that he is an angel. The angel says he will give you a reward, or save you, if you betray somebody (often giving an obviously trumped up rationale for doing so). After the betrayal, the reward either doesn’t materialize, or the angel then betrays the person who did his bidding. I saw the fake angel game played dozens of times during my adventures and for the research that went into making this web site. It usually works, as far as the “angel” getting what he wants.

[27] See Dennis Lee's *My Quest*, p. 162.

[28] See W. Wesley Swearingen's *FBI Secrets*, published in 1995.

[29] The [Jewish Holocaust of World War II](#) is a rich example of perpetrators, accomplices and victims, with scarcely a "hero" to be found. Another example is the "humanitarian" genocide that Belgium perpetrated in the Belgium Congo a century ago. Nearly a thousand Westerners had participated in the incipient genocide in the name of greed before the first person spoke up. Perhaps predictably, the person was George Washington Williams, an African-American. See Adam Hochschild's *King Leopold's Ghost*, p. 114. [John Perkins](#) is about the only "economic hit man" to go public with what his job was really all about.

Observations, Opinions and Dilemmas

By Wade Frazier

Nearly a thirty-year journey finished with this web site's completion. Perhaps the most difficult part of writing this site was navigating between the personal and the objective. The purpose was telling the story of a young, idealistic boy who tried changing the world for the better, and what he discovered along the way, in the hope that some would find it useful. The purpose was not necessarily to tell an [objective tale](#) about the American past, for instance, but to tell [what I was taught about it](#), which is a different issue. Even though it was a personal journey, it dealt with planetary issues.

I began this project with little writing experience, although the talent runs in my family. It has been a long, arduous learning process. I do not feel very competent as a writer, and I even do some writing professionally (in the business realm). Getting out of my own way has been central to the process. I have been in my mid-life crisis since 2000. For several years I waited for it to arrive, listening for the doorbell, only to discover that it snuck in the back door. Mine is not worrying about my aging body, my fading looks or how my career and net worth are faring, but the notion that this thirty-year journey has been futile. I reached the second stage of my mid-life crisis on September 11, 2001, and it has been [agonizing ever since](#). All mid-life crises wrestle with delusions to a degree, and I still get to deal with mine. My [chief feature](#) is impatience; it has been a challenge to try overcoming it, and I am not there yet.

It is said that an artist's work is never finished, and that all artists look at their work with embarrassment after they create it, seeing a hundred ways they could have made it better. It has been continually that way for me as my work has taken shape since 1990. As of September 2002, this site presented about 80% of what I had envisioned for it, and I cannot look at a page without seeing a sentence that could have been better crafted, an observation that the reader could have done without, useful information to add and so forth. I may finish my site by 2010, but may never finish it in the way I originally envisioned.

The trend during the past several years has been making my writing less personal and more objective, although some readers have complained about that, wanting to hear "my voice" more. This site cannot please everybody. The [visions essay](#) is the gist and capstone of this site and my life's work. If enough people begin caring enough, heaven on earth is not far off. The nuts-and-bolts of making it happen are here or nearly so, but humanity is also flirting with making it hell on earth, or worse, with America leading the way. To have [two such diverse outcomes looming](#) can seem intriguing, but since I live here, I hope humanity begins waking up

to its potential before it is too late. For many people it is already too late, and there is not much to do but get ready to roast marshmallows over the dying embers of human civilization. It is not easy to be optimistic these days.

This site's writings have received a vast spectrum of feedback over the years. Some have called it "insane revisionism," others have compared it to the work of [Noam Chomsky](#), David Icke or Guy de Maupassant, while others have accused me of plagiarizing them or trying to rip off the public.

Everybody is entitled to their opinion, and opinions *do* matter, at least somewhat. Our awareness is all we take with us. I have taken nearly all feedback to my work seriously, and feedback has helped. Life can seem solipsistic when sitting at the computer for years on end. Every essay on this site has been somebody's favorite part of it. I am pleased to report that most feedback was of the decent and thoughtful variety, although the viciousness of the [attacks I received](#) (especially after the [World Trade Center attacks](#)) more than made up for the positive feedback I received. It was not worth it anymore to give the public easy access to me.

I cannot say what part of this site may be the "best" (or the "worst") but I *can* say what were the easiest, hardest, and the most and least fun parts to create. The most emotionally harrowing part to write was [my experiences](#) in [pursuing alternative energy](#) with Dennis Lee. I suffered from Post-Traumatic Stress Syndrome for years afterward, and will always be dealing with the aftermath. I am still putting my life back together. A great deal of the personal devastation I experienced is not written about on this site. I still do not want to rewrite my 1992 account of the [BPA Hit Man's](#) activities, although it has been slightly edited since then. I suspect that more effort went into the [medical essay](#) than any other, as well as its related [fluoridation essay](#), although the [American Empire](#) essay was probably the result of more reading than any other.

Writing the [visions](#) part of this site was probably the most fun I had, and I had to save it until the end, as it is this site's capstone. Writing the [spirit essay](#) was a relatively pleasant experience, and where my greatest interest lies. Most of the research done to create this web site felt like diving into a sewer everyday, and a continuous emotional toll has accompanied this long, grinding process. Finishing this site has been a great relief for several reasons. During 1999, I spent a few months researching and writing the first draft of my [war essay](#), and I still [drank then](#), and the daily process was reading and writing for several hours, then getting a six-pack (or more) of beer and drinking it. That essay covers territory that I do not want to revisit, although it is not complete and may never be. The last essay I wrote for my site as of December 2005 was on the [free energy conundrum](#). I hope that it might spark something with certain groups of activists, although I am not holding my breath.

I want to have fun; not study the dark side of our world. Until that dark side was understood, however, I doubted that realistic solutions to our problems were possible. That is why I did it.

This site is about living the harmless life, and focuses on *prevention*, and even if prevention fails (in America, it is virtually never even tried), violence is *never* an answer. The current [cancer paradigm](#) makes that clear. [Medical violence](#) is not the answer for failing to live healthily, but it sure makes a lot of money. Why sell people prevention by the ounce, when “cure” can be sold by the pound?

I doubt there is such a thing as objectivity. While I have tried to stick to the “facts” and keep my editorializing to a minimum, there are readers who want my opinion on various matters, particularly how I see events and the bigger picture. So, this essay will venture some of those views and will deal with mystical ideas I cannot “prove” to anybody. What follows are observations and opinions that some readers may find worth reading, while others will be happy that they are in a far corner of my work, out of the way.

I have never heard of a master denying that humans have souls. Also, no master has denied that souls come here more than once, in a concept loosely known as reincarnation, which not even the Biblical Jesus denied, since he stated that John the Baptist was Elijah’s reincarnation. [\[1\]](#) Although there is a big hole in the New Testament, with more than half of Jesus’ life missing, references to reincarnation survive. Reincarnation may not have been specifically removed from the Bible as many have stated, but the concept was so widely accepted in Jesus’ day that it was a non-issue. Jesus did not talk about it much, just as he did not talk about the sky being blue.[\[2\]](#)

Western materialist attempts to aver that Buddha denied reincarnation [are not convincing](#). Nobody need debate what ancient texts say. Recovering past-life memories is not difficult. I have led group regressions where everybody easily recovered a past life memory. When people [validate past life memories against historical information](#), which many have, doubts about reincarnation quickly fade. People cannot sincerely explore that subject before soon becoming overwhelmed with evidence of reincarnation, and the best evidence is for people to retrieve their own memories and validate them themselves. Then nobody can take away their *knowledge*. Far more convincing than the “knowledge” is the emotional resonance that comes with the memories. The emotional validation stays with people long after the historical facts have been unearthed.

We all live forever. Far better news than that, however, is that physical existence is creation’s most unpleasant plane. Most trans-physical dimensions experience conscious levels of God’s energy, love, that are truly unimaginable to earthly humans. Most accounts of the [human afterlife](#), significantly those retrieved during these days of sophisticated emergency medicine, when people [die and are revived](#), report feelings of love a million times more intense than anything felt on earth. I want to experience *that*, or as close as I can come to it, while I am here. I am less than happy that I live in a dimension so far removed from what is so obvious nearly everywhere else. That is the cruel part of being here, and sources I respect the most,

[Michael](#) among others, acknowledge how cruel earthly life is. All I can seemingly do while here is to try making this existence less cruel.

According to sources I respect, and I plan on validating their information with my own *experiences* before long, souls come to earth from [heavenly](#) and [hellish realms](#), and many places in-between, based on how they have been living. The motion pictures *Ghost* and *What Dreams May Come* are not very fictional, nor is *Star Trek*. While spiritual birds of a feather flock together on the other side, earth hosts many different levels of spiritual attainment. Some are on loan from heaven, more are on leave from hell, and most are middle-of-the-road souls just trying to get through life, and they usually end up in heaven's suburbs, and fairly quickly, [after they pass over](#).

Physical reality is where souls can make the most "progress." Progress to what? Why would we come here, if everyplace else seems so much better? Am I one of the foolish fallen ones? I wonder. I respect the notion that somehow I screwed up to get here. [Michael's](#) notion of leaving the Tao, or religious concepts of The Fall, or *The Course in Miracles'* author saying that this is not what the Creator intended, sounds good to me. So we messed up, or God did not put up good guardrails in Creation, and wayward souls ended up falling into duality and physical existence. If physical reality is a form of rehabilitation for lost and fallen souls, it makes sense. It is difficult to imagine a loving, just and intelligent creator whipping up physical reality, just to see what it was like. If that was the case, then this resident wants out, or at least a good peek at the bigger picture and what I came here to do.

When [Dannion Brinkley](#) had his spectacular NDE, he was told that humans were [mighty spiritual beings](#), among Creation's most courageous, coming to earth to help create with God. That theme can be found in many channeled works, among those having my highest respect, such as [Kryon](#) and [Zoosh](#). Lately (ever since the World Trade Center attacks), Kryon has been giving pep talks to his readers. Kryon, as with many others, says that earth is a unique experiment, and says things that can either be taken as arrogant or reason for hope, such as,

"Someday you'll understand that Earth is unique, the only place where God resides inside the biology called the Human Being."[\[3\]](#)

Zoosh says that humans are becoming the "Explorer Race," and that when we learn to solve our problems, we will help the rest of the universe do the same. [Barbara Marciniak's Pleiadians](#) says that many humans are here today to bust earth's systems, bring love back to physical reality and help seed the universe with it.

I have been dismayed by some post-9/11 channelings. I think there has been plenty of “channel distortion” lately, as the earthly personalities doing the channelings have been under stress. Some channelings have seemed quite naïve, while other times it seems that Pollyanna is being channeled. Maybe that is my mid-life crisis talking, but when a prominent channel said that Bush and gang [invaded Iraq](#) because Saddam Hussein was some kind of personification of evil, my respect for his work declined. That channel is Jewish, and that may have something to do with his Middle East channelings, or maybe he watches too much *Fox News*.

Whether those “cheer up” channelings are arrogant ravings or accurate observations, whether humans are soulless bags of chemicals or creation’s idiots, falling into duality and earthly experience because they gave away their free will and experienced The Fall,[\[4\]](#) and humans are either among Creations’ most derelict souls or among its bravest, the answer to *all* those possible realities is clear: *love is the only answer worth contemplating*.

Even if all the [mystical stuff](#) is hogwash, love is obviously the best of all possible feelings, and the one that most would want to experience as often as possible. By love, I do not mean the highly conditional love that Christians often sparingly dole out to other Christians (or even only to those of their particular sect), or the romantic lust people feel and call it love, or the “tough love” that parades as love these days, but the unconditional love that Jesus spoke of *and lived*, the love that loves the enemy and can raise the dead, the love that forgave Judas, even as Judas betrayed him, and the love that was behind Jesus asking his god to forgive his murderers, for they were blind. The love of a Gandhi, who blessed his murderer even as he fell from his bullets, is the kind of love I mean.

People who are pacifists for purely ethical reasons, peacefully living the Golden Rule simply because it is the right thing to do, may be the most advanced souls of all. Only by caring for each other can the [optimistic visions](#) come to pass. As [Neale Donald Walsh’s](#) god said, what is required is a revolution in consciousness. Nothing else will do it. No ideological system can, no technology can, no trick can, except awakening the human heart; the mind will then follow and our blindness will end. Others argue that the head needs to wake up first, and then the heart will follow. Some are head people, and others are heart people, but the [hells](#) of the astral plane are filled with brilliant people. I want my heart in charge, not my head, while I will not deny that there is an interaction, and one can help the other. As far as I have seen, however, love is queen, and the mind but a prince, and one that readily goes astray without the queen’s guidance.

There are many bodies of mystical material that describe humanity’s spiritual state, and Michael’s concept of [soul ages](#) is common. No age is better than any other, although the younger ages are the most self-centered ones, just as children are usually the most [self-centered](#) humans. Younger souls thereby incur the largest burdens of negative karma, which

they spend their later lives paying back. Nobody likes being called a Baby Soul, so I will use a soul-stage concept, using stages one through seven to correspond to Michael's soul age concept, where [stage-one](#) equals Infant Soul, and stage-seven equals Infinite Soul.

Michael's emotional detachment and seemingly sterile observations, where he observes that if [humans destroy their planet](#), they will “merely” find another suitable life form (probably without the means to manipulate its environment), and continue their evolutionary journey, can be unsettling. Even with such non-judgmental detachment, Michael admits that the evolutionary process *is* one way, and love is the greatest goal while in physical reality; the love that accepts everybody just as they are, which Michael calls agape.

Similar to Maslow's Hierarchy of Needs, stage-one souls are into survival. Stage-two souls believe in following rules. Stage-three souls believe that winning is *everything*. Stage-four souls explore their emotions, and stage-five souls are into love and acceptance. Each stage can choose love or fear, although earlier stages are more vulnerable to fear and being locked into their negative [overleaves](#), such as the warrior who coerces rather than persuades, the king who plays tyrant instead of master, the pragmatist who is dogmatic instead of practical, the soul exploring aggression who is belligerent rather than dynamic, and the idealist whose perspective is naïve rather than integrative.^[5] Michael says that the physical plane's great hazards “trip up” most souls, and in only about a third of its lifetimes will an older soul manifest its true stage of development. The United States is a stage-three culture, and stage-five souls usually fall prey to a stage-three culture's conditioning, and rarely manifest their stage-five soul awareness, with their life's goal being winning more than loving.

Religious fanatics, [nationalist flag-wavers](#) and many others from the political right are operating from stage-two soul awareness. Nationalism is a form of false consciousness, generally used to herd and control people, something obvious to [Orwell](#) and others. As the United States began acting more at variance with its founding ideals, [ideologists began concocting symbol-worship](#). Just as America completed one of history's greatest genocides, it [began worshipping the American flag](#) and [pledging allegiance to it](#). The use of flag worship, Bible worship and other idolatry was largely stage-three ruthlessness used to manipulate stage-two inexperience. The people running the White House, corporate America, and other parts of world's power structure often (if not predominately) operate from the negative pole of stage-three awareness, and humanity today is at the cusp between stages three and four, which Michael says is the greatest transition that any ensouled species makes, as it turns the corner from the outward journey to the inward journey. Michael says that a third of time an ensouled species does not “turn the corner,” but instead destroys itself, a third of the time by warfare and two-thirds of the time by destroying its environment.

America's radical left is largely operating from stage-four awareness. Although they often manifest the emotional depth typical of their stage, and have mostly rejected America's triune

faith of capitalism, nationalism and organized religion, they still largely wear stage-three's materialistic blinders, which keeps them locked into the [Zero-Sum Game](#). They often believe their mission is mainly about tackling the corporations, governments and others abusing their power. They have yet to realize it is power *those abusers have been given*. Protestors of abuse by the powerful are mostly addressing evil's branches, not its root, and their ideology (believing in "structural analysis" to the extent they have knee-jerk rejections of the idea of [conscious manipulation of the system](#)), has helped blind them to the [possibilities of free energy](#), why it is suppressed, and how they can truly be an agent of change. They can open their eyes to a paradigm of abundance and love that few can imagine today. They also believe in violence as a solution.[\[6\]](#) They are so *close* to "getting" it, and this web site is partly aimed at them.

The mystical community is trying to bring stage-five awareness into play, and that they are [mostly women](#) is no accident. There can be naïveté and other problems in that community, and most mystical charlatans are men.[\[7\]](#) I am always suspicious when a man channels, "sometimes, you just need to kill people."[\[8\]](#) So, when is that? I prefer what [Seth says about the subject](#) to what any man channels about it. Male hormones can get in the way, and Jesus' temple tantrum shows that even masters are susceptible to its seductions.

If "Utopia" comes into being, it does not mean that all of humanity's problems disappear, or stage-two souls instantly become stage-five souls, but everybody can begin operating from the positive poles more often (operating from love). Desperate people do desperate things, and then operate from their negative overleaves, even seemingly frozen into them. If we eliminate human desperation, a lot will *immediately* change.

For those who think life is all about survival, *everybody* dying is not a success. For those who think that life is all about following the rules, whose rules? Rules drilled into our heads by rote so we could be controlled, or rules we discovered by our *experience*? How about [the rule of love](#)? For those who think life is all about winning, what kind of prize is it if everybody loses? What if *everybody* won? For those who think life is an intense emotional trip, how about if our lives were a trip of intense love?

About the only flag worth rallying around is the one below, courtesy of Alice Weiss.

It is the life flag. Every being with DNA can salute it, and honor every other creature with DNA as a fellow traveler.

[Real wealth](#) is health, cleanliness, pure and alive food, a secure and healthy environment, happiness, free time, etc. Gold is fool's wealth, a [mere symbol of it](#). Amassing piles of toys or "capital" is on one hand slightly less foolish, but also can be the [ticket to hell](#), and is quickly destroying the planet. To possess *nothing*, but to have use of whatever is *needed*, is an ideal that the "primitive" natives lived that the [European explorers encountered](#), and how the people depicted on *Star Trek* live. The ideas put forth in the [optimistic visions](#) can take humanity's real wealth to levels economists cannot begin putting numbers on. Such a transition would collapse many economic card houses, where *assumptions* of [greed](#) and [scarcity](#) simply evaporated. Rockefeller's [University of Chicago](#) would become unrecognizable, and might also vanish. The [Zero-Sum Game](#) would end, and humanity would begin to understand true abundance, which begins in the heart.

The best solution to toxic waste is to not create it in the first place. In the [optimistic visions](#), there would be no creation of toxic wastes, and what little might be created in intermediate steps can be easily isolated in safe environments and combined or reduced back into harmless substances. There would be no fluoride ions introduced to the environment, no persistent organic pollutants, no radioactive materials, and so forth. An intelligent and loving chemistry would be practiced, not the greed-driven and spiritually blind chemistry of today.

Creating and joining hierarchies may be how humanity lost its divine awareness and took The Fall. Hierarchical social, political and economic structures are a [dark path student's](#) dream, where the lever over it all is the coveted prize. The steeper the hierarchy, the more the dark path folks like it. That [hellish world Roads visited](#) was steeply hierarchical, literally, with those

at the food's chain's apex living in the penthouse. Today's world, where a Bill Gates has more "wealth" than that of 100 million of his fellow countrymen combined, is the wonder of [capitalism](#) and a dark path triumph. Native American societies, such as the stage-five [Iroquois culture](#), had little hierarchy, and no one person was vested with much "power." Their form of government became the model for the U.S. Constitution, but inventing the executive branch was the monarchical Europeans' first and greatest corruption of the Iroquoian system, and the executive branch has been the primary vehicle of undermining the American government. One way to tell if America really begins maturing is when it abolishes the executive branch altogether. Corporations are also steeply hierarchical institutions, and their abolition (or a radical redesign of them, making them vehicles of service of Creation, not as servants of greed and exploitation) will be more evidence that humanity is growing up. Ideologists have labored long and hard to make corporations and governments seem forces of nature, and as unchangeable, but they are human-constructed systems, often designed to exploit the many in favor of the few. They can be *reconstructed* or *deconstructed* as well.

There are no hierarchies in heaven, and nobody rules there. [Zoosh](#) says that the being Christians call Archangel Michael prefers to be known as Uncle Mike, and he likes putting his feet up on the table at gatherings of his pals. Yes, he may be "older," vaster and grander than earthly souls, but Uncle Mike would never say he was better, nor would he want to be "in charge."

The [full vision](#) would have perfect environments to grow crops, mostly fruit that would be eaten live. Human waste would be recycled, and not like the Chinese night-soil method, but in a way that would be as clean as everything else in that potential world. Human crops would have everything they needed to grow perfectly, and human love directed toward plants would be part of what those plants thrived off of. Creating a healthy and nutrient-rich [vegetarian](#) diet would be child's play in that potential world. There might be *some* need for artificially "fixing" nitrogen from the atmosphere, as a raw material for plants and microscopic organisms to use, but the awesome pollution seen today, such as the huge "[dead zones](#)" in the oceans, would not accompany that process. Soils would not be destroyed, nor would they blow and wash to the oceans as they have for the past several thousand years. The world's soil levels, one of the greatest measures of real wealth on earth, would increase greatly, and could support a myriad of life even greater than existed before the rise of domesticated humans.

The [housing industry](#) as known today would disappear. There can be artistry in creating dwellings that make Robert Jordan's vision of Tar Valon appear tame and unimaginative.[9] Dwellings could last thousands of years, or be completely recycled, with zero environmental impact. Imagine swimming pools with ninety-degree water, distilled and continually being recirculated and purified. Every home could have one, with a robotic lifeguard, among its other functions.

With free energy and an awakening of the human heart, those realities are not far off. In the

future worlds that [Wambach](#)'s subjects saw, there was even a community that stopped eating. Touching a musical disk every day gave those people all the energy they needed. Beyond electron energy is the healthier photon energy (the energy of light), and technology can literally become alive at some stage of our awakening. There is plenty of channeled material that speculates along the lines of this site's vision, and some has influenced me somewhat, although most of [my vision](#) is simply the fruit of pondering the possibilities of free energy for nearly thirty years, and what it could catalyze.

For instance, in the [Alexander](#) material, some of the communication revolution's possibilities were discussed. There can be interplay of technology and consciousness, where one assists the other. That [heavenly world](#) Roads saw was like that. As the human heart opens, so will the abilities of human consciousness. Telepathic abilities are already returning. Alexander says that communications technology can assist that evolution, and people could have a chip in their heads that can be part of a global communication system, linking everybody to everybody. It would not be subject to Big Brother control, but a tool of an awakened humanity, something to be discarded as our full telepathic abilities return. Language was invented when humans lost their mind-to-mind communication abilities. As with those [two worlds Roads saw](#), high-tech can be used for good or evil. I would not want anybody putting a chip in my head in a nation that [George Bush the Second](#) ran, but in an awakened humanity, I might sign up. Also, I do not trust any of today's [genetic "engineering,"](#) because the heart is not in charge in today's world.

Paddy McMahon channeled a version of Utopia in his *The Grand Design* series.^[10] In that vision, earthly Utopia began in a small nation that formed from stage-five souls, which created a political entity that does not exist today, of a few million people. They had no weapons; they raised the world's healthiest food and showed the rest of humanity what was possible. The vision given McMahon was about a generation into our future (after the big karmic blowout that may be just around the corner, which I hope as many survive as possible). That Utopian culture was largely vegetarian, as [carnivorism and violence are directly related](#). Humanity began realizing what was possible through their example. Evil-minded people simply could not handle the "vibe" there, which is why truly enlightened beings never need weapons. Our so-called "[space brothers](#)" from nearby star systems have defensive technology, but it is truly defensive, not adhering to the human adage that the best defense is a good offense. If beings come at them with hostile intent, their defensive technology does stuff like put the assailants to sleep. Then they wake up with their weapons gone. Also, love the enemy *works*. Those on the [dark path](#) have no idea how powerful love is.

The dark path folks *want* the so-called light workers to fight them. The simple act of seeing them as bad guys and wanting to fight them already makes the dark path team the winners, as it immediately adopts the victim paradigm. If humanity stopped being [such easy meat](#) and simply woke up to our own divinity, the dark path gang could no longer play their games, and

they would go away (and some might even abandon the dark path and seek rehabilitation).

If Americans choose to wake up they can help bring the world of this site's vision into being, and far beyond it, and soon. It cannot happen as long as people refuse to accept responsibility for their lives, playing the victim. People have karma, families have karma, and even nations. [America's karma](#) is dark and heavy, and the [World Trade Center attacks](#) were relatively gentle compared to what may be coming. The ethical bankruptcy of George Bush the First, [self-righteously defending mass murder](#), is not the kind of behavior that will bring a healed world into being. A sign of America's growing maturity will be when we face up to our vast crimes and seek to repair the damage. This site's vision is something that Americans are in a better position than anybody else on earth to begin to make happen. There are not yet death squads roaming American streets to wipe out people such as me, as they have done in [American client states for generations](#). Americans have to do little more today than just be willing to wake up, realize they have been lied to since their cradles, throw that garbage out, begin finding their inner strength and live by their hearts and the truth. Everything is easier said than done, but Americans are uniquely blessed in many ways, and are in the best position to begin turning earth into a true paradise.

There is an enlightened way to balance karma, and an unenlightened way that can lead to further rounds of agony. There does not have to be an Armageddon. Karma can be balanced in positive ways, not in eye-for-an-eye fashion. In this [site's vision](#), all Americans need to do is stop raping humanity and the planet, put their flags away and think a little, and they can embrace free energy and a host of wonders. *Everybody* can win. Then Americans can create a real Peace Corps, not the [neocolonial](#) tool that the [Peace Corps](#) partly is today. If America gets its act together, it can truly lead the world by its example, not by its murderous bullying and thievery. With our dark history, most people of other nations have little reason to trust our nation's motivation. If the peoples of other nations *invite us to*, encouraged by our new mature and responsible behavior, then we can perhaps help them attain what we may accomplish. It will take a long time of truly good works to change the view the world justifiably has of the United States. America is despised for good reason, with history and current dynamics that all the [flag-waving](#) can never completely hide. That can change, but it depends on *our* behavior. We are not so different from anybody else. Humans have far more in common than they do differences.

One paradox of today's world, and it has been this way for a while, is that the people who can least afford to raise children are the ones having them. Africa, Latin America and Asia have the world's highest birth rates, while Europe, North America, Japan and Australia have the world's lowest. Why is that? The colonial dynamic easily explains it. When the colonial powers [raped the world](#) they commandeered most of earth's humanly available resources. The subject peoples, for those who were not simply exterminated and their continents taken from them, have suffered from severe privation ever since. In the imperial world, children are seen differently than in the colonized world. In America for instance, children are a big

economic investment for no payoff (parents no longer live with their children when they get old, or use them as farmhands), so people have children for reasons other than economic gain and security. Most of the industrialized world has birth rates below population replacement rates. In the colonized world however, the long grind of [colonial](#) and [neocolonial](#) exploitation has rendered them so impoverished that children are the only assets they can enjoy; being exploitable labor when young, and pension plans when the parents get old.

An awakened humanity might decide that a billion people are all that should be on earth, or perhaps fifteen billion people living lightly on the earth is desired so as many souls can evolve as possible, in as positive an environment as possible. If the colonized peoples get away from the ragged edge of survival, they will no longer be *motivated by desperation* to have children. Children can be cherished for who they are, not seen as exploitable assets.

With love, anything is possible, and vistas we *cannot imagine* today can come into view. The future we will experience is up to each one of us, and will develop from what we *do* today. We all possess tremendous power to change our world for the better. Will we use it?

Peace.

Footnotes

[1] See the gospel of Matthew.

[2] See David Moore's *The Christian Conspiracy*, for instance.

[3] See Kryon, given through Lee Carroll, *Sedona Journal of Emergence*, September 2002, p. 30.

[4] See Paddy McMahon's *The Grand Design* for more on that idea.

[5] For an easy-to-read table of the positive and negative aspects of overleaves and roles, see José Steven's *Earth to Tao*, p. 254.

[6] The radical left usually subscribes to Enlightenment ideals and generally believes in materialism, with deism about as spiritual as any of them get, [David Edwards](#) being an encouraging exception to that rule. Consequently, [Howard Zinn](#), [Noam Chomsky](#), Michael Albert, Ward Churchill and others in my Pantheon of great souls all believe in violence. It is not their first answer by any means, but they all believe in its power to do good, to counter the "bad guys." Churchill and his co-writer sounded like

Machiavelli in finishing their *The COINTELPRO Papers*, where the FBI's evils were laid bare, by writing, "Under the circumstances, the FBI and its allies must be combated by all means available, and *by any means necessary*." See Churchill and Vander Wall's *The COINTELPRO Papers*, p. 328. Once the materialistic blinders are shed, violence can be seen for what it ultimately is: *an attack on ourselves*. We *all* reap what we sow.

[7] I was recently asked if I knew of even *one* man in the mystical community who did not use his power and position to have sex with women seekers, make a pile of cash at the expense of others, or other abuses of his positions and "powers." I had to think long and hard, and the few I thought *might* have made the grade I did not know very well. The New Age community is more than 80% women, and the few men there, if they are not *very* strange, have alternative hairstyles, mystical jewelry and other trappings; few can hold down a job, and the most accomplished often use women in the way that hummingbirds flit from flower to flower, sampling the garden. I have seen countless women look high and low for "enlightened" men in the "movement," and virtually all become bitterly disappointed when their search comes up empty.

[8] Neale Donald Walsch and Paddy McMahon have channeled variations on that theme.

[9] See his *Wheel of Time* series, particularly *The Great Hunt*, chapter 18.

[10] See McMahon's *The Grand Design*, esp. pp. 166-201, in volume 2.

Paul Bragg's Tarnished Legacy

By Wade Frazier

May 2007

[Introduction](#)

[Bragg's Claims – His Health Advice](#)

[Bragg's Claims – His Life's Story](#)

[The Documentary Evidence](#)

[Conclusion](#)

[Footnotes](#)

Introduction

When I was twelve, my father [discovered a booklet that saved his life](#), which prescribed a live food diet to reverse hardening of the arteries, and it did. That booklet was later [banned in the United States](#). When I was seventeen, my father brought home a book that prescribed a holistic health regimen that was based on live food, pure water, exercise, sunshine and fasting. The book was Paul Bragg's magnum opus, *The Miracle of Fasting*. It was generally my final influence in matters of holistic health.

I [recently encountered allegations](#) that [Bragg lied about his age](#), claiming that he was fourteen years older than he actually was. I was shocked, but it resolved several aspects of Bragg's life's story that made me wonder over the years. In addition, I had doubts about how his legacy was being handled.

Bragg's Claims – His Health Advice

When I first read *The Miracle of Fasting* in 1975, Paul Bragg was still alive and living in Hawaii. He died the next year. There are two lines of Bragg's claims that this essay will address:

1. The validity of the health regimen that Bragg promoted;
2. The validity of his life story, which he used as proof that his regimen worked.

The validity of Bragg's regimen, in light of what appear to be fabrications about this past, should only be verified by independent means, and is somewhat beyond the scope of this essay, but not entirely. As I recently reread parts of *The Miracle of Fasting*, much is consistent with alternative and (increasingly) mainstream health literature, as well as with the personal experiences of others and myself.

I began a [fasting regimen](#) after reading *The Miracle of Fasting*, but abandoned Bragg's water fasting advice after six years, and have done juice fasts ever since. Other parts of Bragg's regimen did not work for me. One of the Bragg Empire's bestselling products is Bragg Liquid Aminos, which is essentially soy juice. I had some about twenty years ago, got sick from it, and have never had it since. I dare not even consume soy sauce.

To revisit the [booklet that saved my father's life](#), live food is obviously what all animals are designed to eat, including humans. Humanity's ancestors began evolutionary adaptations as [they left the trees and learned to walk erect](#). The dietary adaptations of the [hunter-gatherer lifestyle were highly significant](#), including the addition of more flesh and cooking food. The [Domestication Revolution](#) introduced radical changes in the human health regimen, including the development of seed and root crops and milk products, sedentary living, new diseases and the beginning of economic, political and social hierarchies – in short, civilization. The [Industrial Revolution](#) introduced even greater divergence from our evolutionary heritage, and obesity has become epidemic in the West. Americans are [history's fattest and most sedentary humans](#), with two-thirds of us dying of easily preventable degenerative diseases, with arterial disease and cancer being the most prominent.

Bragg was far from alone in advocating live food, fasting and exercise as preventives and cures for civilization's diseases. Bragg's most impressive pupil is [Jack La Lanne](#), who is ninety-two years old today and still vigorously exercises and weight trains for two hours each morning and strikes muscleman poses. If Bragg was not living proof of the validity of exercise and nutrition, La Lanne is.

I first read about [how fluoride was a poison](#) by reading Bragg's *The Shocking Truth about Water*. I have largely consumed purified water for the past thirty years, being very strict in my late teens, when I went years without drinking tap water.

The water fasting, sunshine, vinegar, soy juice and other aspects of Bragg's regimen I have my doubts about. They may have validity, but people should independently investigate such health practices, and in fact [all health practices](#), both orthodox and alternative, to see what works best for them.

Bragg's Claims – His Life's Story

Bragg made a set of claims to support his health advice's validity, which comprise this essay's central focus. The story repeatedly told in Paul Bragg's books and interviews, and promoted by Patricia Bragg for many years, is related below.

Bragg was born in 1881 and raised on the family homestead in Virginia.^[1] His great grandfather was Confederate Civil War General Braxton Bragg.^[2] Bragg said that his diet was "terrible," with about 90% of it coming from a frying pan.^[3] At age sixteen, Bragg developed tuberculosis. After being given four months to live by his doctors, Bragg was taken by his nurse to the Swiss tuberculosis clinic founded and run by Dr. August Rollier. Bragg was cured by Rollier's treatment, which was based on live food, sunshine, fasting and exercise, with many health miracles attending his recovery. Bragg then devoted his life to what cured him and became a real-life superman. He was able to help his sister, Louise, attain glowing health after she had been sickly for her entire life. She then led a "fairy-tale" existence after Paul improved her health with his regimen.^[4] He wrestled in the Olympics in 1908 and 1912, fought in all the major battles of World War I, played tennis with Teddy Roosevelt and taught Teddy's sons boxing, met most of the U.S. presidents since then, and founded the first American health food store in Los Angeles in 1912.^[5]

Bragg then became the health consultant to the stars, with clients such as Gloria Swanson, Zsa Zsa Gabor, Clint Eastwood and Elizabeth Taylor. In his later years, his daughter Patricia was his assistant. Bragg moved to Hawaii in the 1960s and promoted his longevity, saying that he planned to live to be 120 years old. He swam and exercised for hours each day, and was living proof of his regimen's validity. There are many newspaper articles on Bragg in his later years.^[6] In them, Bragg makes many claims, including his 1881 birthday.

Six months before he died, Bragg was injured in a drowning incident in Hawaii. His health declined after the incident, while he kept up his speaking tours. While in Miami on tour, he collapsed and died of a heart attack on December 7, 1976, at age ninety-five.^[7] On his death certificate, on which Patricia Bragg is listed as the informant, Paul's birthday is documented as February 6, 1881, and his state of birth as Virginia.^[8]

That is quite a story. Unfortunately, recent research into Bragg's past reveals that very little of

the above story appears to be true.

The Documentary Evidence

I began having nagging doubts about Bragg's legacy when I read some Bragg Empire literature published not long after he died. When Bragg was still alive, I read an article about him in *People* magazine, published in about 1976. Bragg was asked at what age sexual activity ended, and he replied, "You'll have to ask somebody else, because I am only ninety-five." In the early 1980s, I read a reproduction of that article published by the Bragg Empire. That memorable quote instead read, "You'll have to ask somebody else, because I am ageless." The pictures that Bragg produced of himself in his books showed somebody who looked remarkably young for his age, perhaps *too* remarkably young. In a picture that Bragg said was taken in 1932 in Los Angeles, he looked like a Greek god, a deeply tanned, muscle-bound man in his thirties, although he was allegedly in his fifties.^[9] Pictures like that were impressive evidence that Bragg's regimen worked, turning himself from a dying tuberculosis victim into a superman. In pictures from his books, taken in his last years, the photos appeared to have been airbrushed, to presumably give him a more youthful appearance.

Patricia Bragg, who calls herself Paul's daughter, began using the word "crusade" to describe Paul's life's work. I did not recall Paul ever using that term while alive, but Patricia said "crusade" in his obituary, so maybe Paul called it that, but virtually all of the books I have, some published when Paul was alive, do not mention the word "crusade," although there is plenty of Bible-quoting in them. It appears that Patricia began using the term "Bragg Crusades" in the books around a decade after Paul died. Also, Patricia would imply in updated versions of Paul's books, published years after his death, that he was still alive. Patricia has disguised her age for many years.

Recently, researchers have investigated Bragg's claims and have located census records, Bragg's draft card, immigration records and numerous newspaper articles, stretching from 1913 to his death in 1976. In light of the documentation, very few of Bragg's life's story claims appear genuine. According to the U.S. Census of 1900, Paul C. Bragg was born in Indiana in February 1895, [not in Virginia in 1881](#).^[10] See the image below.

Click on image to enlarge

In the 1910 U.S. census, Bragg's birthplace of Indiana and birth year of 1895 is repeated.^[11]

Click on image to enlarge

When this information came to light, some challenged it, suggesting that it was a different Paul C. Bragg. Below is Bragg's 1917 draft card, signed by Bragg himself. Bragg presents his birthday as February 6, 1895, in Batesville, Indiana, and his profession as a life insurance salesman.[\[12\]](#)

Click on image to enlarge

Bragg's application for his social security number has also been obtained. It is reproduced below, and I have redacted his Social Security number from it.[\[13\]](#)

Click on image to enlarge

The signatures on the draft card and Social Security Number Application are virtually identical to the signature in Bragg's books. See a comparison, below. It is the same Paul C. Bragg.

Click on image to enlarge

On the draft card, Bragg wrote that he had been a private in the National Guard for the previous three years, and he requested exemption from the trenches in World War I, citing his dependent wife. His story about being in all the [“major battles” of World War I](#) seems doubtful.

Bragg's birth certificate has been discovered on microfilm in a public library in Batesville,

Indiana, where Bragg's [draft card](#) indicates he was born. The birth certificate confirms Bragg's 1895 birthday, and the [birth certificate's details](#) are presented at this footnote.[\[14\]](#) His birth was also announced in the local paper.[\[15\]](#)

It appears that Paul Bragg began lying about his age in the 1920s, when he began crafting his image as a health guru whose youthfulness was evidence of his message's validity.

Paul's heritage has been traced to Indiana since the mid-1800s, when his great grandfather, Andrew Bragg (not [Braxton](#)), moved there from Tennessee not long before Paul's grandfather, James H. Bragg, was born.[\[16\]](#) The "[family homestead in Virginia](#)" claim appears false. Paul's father was not a farmer, but a printer who worked for the U.S. government and moved to Washington D.C., where Paul was raised, in about 1898.

Paul's claim of being [cured of tuberculosis](#) at [August Rollier's](#) Swiss clinic also conflicts with his claim of being born in 1881. Rollier [founded his clinic in Leysin, Switzerland in 1903](#), which is about five years after Paul would have allegedly been cured there. Rollier was an MD born in 1874, so would have been only 24 years old when he treated Paul, if Paul's tale is true – a bit young to be an MD founding a clinic.

Paul began making the news as early as 1913, when he allegedly rescued two men from drowning. Not long after the rescue incidents, Paul left his home in Washington, D.C. and passed through Indiana on the way to a short-lived job in Missouri. In September 1913, Paul Bragg came to Indianapolis and bet \$1,000 that he could outwrestle anybody in his weight class. He was reported as being eighteen at the time.[\[17\]](#)

At age eighteen, instead of recovering from tuberculosis and learning to fast under Dr. Rollier's instruction, Bragg was rescuing drowning victims and challenging all comers to a wrestling match. There is also no record of Paul in the East Coast U.S. immigration archives during those years. It appears that Bragg may have never had tuberculosis, and so was never treated at the Swiss clinic for TB.

Where an eighteen-year-old boy could get \$1,000 in 1913 to bet on his wrestling skill is another mystery. In 1918, at the peak of World War I industrial activity, [American family income was about \\$1,500](#) and U.S. government workers made an average of \$0.49 per hour, up from \$0.28 in 1901. To have \$1,000 to wager (which was probably more than his father's income for the entire year) on his wrestling prowess is impressive, but in light of these revelations, I doubt he had the money to wager. Paul's claim of [founding the first health food store in Los Angeles in 1912](#) also appears unlikely, as does a different claim, when Bragg said he founded the store in New York City in 1912.

Bragg was apparently an accomplished wrestler and swimmer, but in 1908 he was only

thirteen years old – a little young to make the [Olympic team](#). According to the available records, Bragg was not on the 1908 or 1912 Olympic teams.[\[18\]](#)

None of the genealogical investigation performed so far has discovered any record of [Paul having a sister](#); he appears to have been one of three boys born to his parents, although his mother was in a marriage previous to the one in which she gave birth to Paul, so Paul may have had some half-siblings. However, according to Paul's story of his sister's health miracle, it happened soon after Paul's stint at Rollier's clinic, which we now know is probably a fictional event. Paul's sister might well have led a "fairy-tale" existence.

After his National Guard and life insurance salesman days, Paul became the physical director of the Frederick, Maryland YMCA in 1919, where he worked for a year. He was twenty-five years old when he resigned, apparently partly due to the YMCA's financial difficulties. For the next decade, the documentary trail is a bit sketchy at this time, but newspaper articles say that he moved around between South Carolina, New York and California, and apparently took a couple of trips to Polynesia in the early 1930s. In an interview in the *Dallas Morning News*, on April 12, 1929, Bragg gives his age as 49. He was really 34. His given age of 49 was not even consistent with his alleged 1881 year of birth. Paul also had some trouble with the authorities, as well as patients who sued him.[\[19\]](#)

From 1929 onward, Bragg kept to the story of his 1881 birthday until he died, unless he was dealing with American officials.[\[20\]](#) Patricia Bragg is *not* Paul's [daughter](#). Patricia is Paul's *former daughter in-law*. Paul's son Robert E. Bragg married Patricia Pendleton. Patricia was born in Alameda County, California, on April 29, 1929. In 1955, Robert and Patricia divorced, the divorce being final in 1956.[\[21\]](#)

This is not the only instance of American health pioneers having inflated claims of age. Many sources have claimed that Norman Walker, a juice fasting pioneer, lived to be well over one hundred years old. Recent research showed him to be [ninety-nine when he died](#), a ripe old age, to be sure, but far less than the claims made for him. In addition, some of Walker's claims regarding his credentials are dubious, such as the number of autopsies he attended and the degrees that he held.

Conclusion

Throughout Bragg's literature, he called himself a "life extension specialist." Lying about one's age is one way to "extend" one's life, but it is a fraudulent method of amassing life-extension credentials. Throughout Bragg's many publications, the author's biography began with, "Paul C. Bragg is himself the best testimonial for the value of his teachings." Today, that claim

appears ironic. The author's biography I am citing then stated what feats of endurance he was still capable of, even though he had been dead for several years when that edition of his booklet was published.[\[22\]](#)

In light of this essay's information, it is legitimate to question everything about Bragg's health advice, as well as his life's story. Many of the miraculous healing events that he cited in his own life, such as being [cured of TB](#) or passing mercury at his family homestead, do not jibe with when and where he was in those days. Did Bragg even fast all that much? He still looked pretty good at age eighty, but not *that* good. How much of his image was genuine? Did people following Bragg's advice damage their health? While the message may have been worthy, the messenger was dubious.

Bragg's apparently crafted a saleable life's story from *some* fact and large doses of fantasy. Being a life insurance salesman during World War I seemed an appropriate profession for him, as [the entire industry was viewed as a scam](#) in those days. I was raised in Southern California and worked in Los Angeles for five years. About half of my friends in LA were either in the entertainment business, used to be in it, or were trying to break into it. In LA, everybody wants to be somebody, people adopt stage names and forget their pasts, or invent more marketable ones. For Bragg to gravitate to LA, making a name for himself as a "life extension specialist," with fabricated credentials, is a typical Hollywood story. On a side note, while the California medical authorities were [persecuting genuine alternative cancer doctors](#), Bragg received a free ride. I [saw a similar dynamic](#) during my free energy days.

Bragg's books continue to be sold today, as the Bragg Empire barrels along. I see little potential harm and great potential benefit from the regimen that Paul promoted, but Bragg's lies were greater than little white ones. *Caveat Emptor*.

Footnotes

[\[1\]](#) His claims about being raised on the family "homestead" in Virginia are many. See, for instance, Paul Bragg's *The Miracle of Fasting*, 1976 edition, p. 64, 78.

[\[2\]](#) See William Helton's "Bragg's Motto: to rest is to rust" in Honolulu's *Sunday Star-Bulletin & Advertiser*, August 24, 1969.

[\[3\]](#) See Paul Bragg's *The Miracle of Fasting*, 1976 edition, chapter 3, p. 28.

[\[4\]](#) See Paul Bragg's *The Miracle of Fasting*, 1976 edition, chapter 17, pp. 102-103.

[5] Those stories are found throughout articles written on Bragg before he died. On his founding America's first health food store in 1912, see Ron Staton's "Bragg Could Brag About His Fitness," *Honolulu Star-Bulletin*, p. A-17, November 29, 1972.

[6] See also: Dave Koga's "Nonagenarian Has Lots to "Bragg" About," *Honolulu Star Bulletin*, May 6, 1975; Alston Vizzini's "Bragg and his diet are tied to be fit," *Honolulu Advertiser*, April 6, 1972.

[7] See *The Miami Herald*, p. 10-B, December 10, 1976.

[8] The State of Florida's Department of Health and Rehabilitative Statistics issued the death certificate, file number 76-084611, and it presents the same Social Security number that is on Paul's [1949 application](#). It can be obtained by contacting the Florida Department of Health.

[9] See Paul Bragg's *The Miracle of Fasting*, 1976 edition, chapter 22, p. 121.

[10] The census records are in the public domain, and can be obtained from the U.S. government, through The National Archives.

[11] Spence M. Grayson enumerated that census record, on April 19, 1910.

[12] A copy of the public domain draft card can also be obtained through The National Archives.

[13] A copy of the public domain social security number application can be obtained from the U.S. Social Security Administration.

[14] Below is the information obtained from Paul Bragg's birth certificate, which has the same birthday and birthplace information that is on Bragg's [draft card](#).

Child of this mother: 2

Sex: M

Color: W

Date of Birth: Feb 6, 1895

Place of birth: Ripley county

Born alive: yes

Legitimate: yes

Natural Labor: yes

Difficult Labor: no

Mother's Maiden Name: Carrie J. Chappies

Mother's age: 29

Fathers name: Robert E. Bragg

Father's age: 29

Father's occupation: Printer

Fathers place of birth: US

By whom return is made: J.R. Davies

Post Office address: Batesville

[15] See the *Batesville Tribune*, February 14, 1895, p.1, under the local news heading, which reads, "To R.E. Bragg and wife on Wednesday night, February 6th, a boy."

[16] According to recent military history research, Braxton did not have children. Also Braxton was a native of North Carolina, while Paul's great grandfather (Andrew) and great grandmother (Mary) with the Bragg surname were born in Tennessee, according to the 1850 census. Andrew and Mary's eldest child was born in Tennessee, and their second child, James H., was born in Indiana.

[17] See "Amateur, in City Few Hours, Offers \$1,000 Side Bet He Can Defeat Any in Class," *Indianapolis Star*, September 18, 1913.

[18] Via USA Wrestling in Colorado Springs, Colorado, the below lists of American wrestlers on the Olympic teams of 1908 and 1912 were obtained from Mike Chapman's *Encyclopedia of American Wrestling*. For the 1908 games held in London, freestyle was the only style contested. The U.S. team had six members, who were:

Name	Weight Class	Results
George N. Mehnert	119	Gold Medal
George S. Dole	132.5	Gold Medal
John H. Krug	146.5	Eliminated in the second round
John Craige	160.5	Eliminated in the second round

Frank Narganes	160.5	Eliminated in the second round
Lee J. Talbot	160.5+	Eliminated in the second round

For the 1912 games held in Stockholm, Greco-Roman was the only style contested. There were only two American wrestlers on the team, who were:

Name	Weight Class	Results
William J. Lyshon	132	Eliminated in the second round
George W. Retzer Jr.	132	Eliminated in the second round

[19] On the East Coast, Paul had trouble for practicing medicine without a license, and in California, he was found guilty of the “betrayal” of one of his eighteen-year-old clients. The judgment was \$4,000, and after Bragg reportedly told the woman that he would leave the state to avoid paying the judgment, and employ a legal gambit in order to shield his assets from attachment, he was jailed. Bragg reportedly admitted that it was not the first judgment that he had evaded in that manner, and that his evasion techniques were justified, as “all is fair in love or war.” See “Betrayal Case Decided for Girl,” *Los Angeles Times*, April 6, 1934 and “Judgment Case Figure Put in Jail,” April 14, 1934.

[20] See, for instance, the immigration record for the voyage of the S.S. President Roosevelt, sailing from Bermuda on June 24, 1940, to the Port of New York. Paul C. Bragg was passenger 30, and the record stated that he was born on February 6, 1895 in Batesville, Indiana, which is consistent with his [draft card](#).

[21] See “Son Accuses his Wife and Father in Court,” *Los Angeles Times*, December 21, 1955. See “Son Drops his Charge Linking Wife, Father,” *Los Angeles Times*, January 17, 1956. The articles can be obtained online from the *Los Angeles Times*, for a nominal fee. In the accompanying photographs, the Patricia Bragg who was married to Robert is obviously the same person who calls herself Paul’s daughter today.

[22] That quote is from the back page of Bragg’s *Super Brain Breathing for Health and Energy*, in the 1980 edition.

[Return to My Home Page](http://www.ahealedplanet.net/home.htm) (The address on the Internet of my home page is <http://www.ahealedplanet.net/home.htm>)

The first image was taken in 1997. The second was taken in 2005. That is the same rock to my right in both images. There is no visible glacier in that second image. In the third image is from 2005, from closer to the glacier. As you can tell by comparing the mountainside above the glacier in those images, all the water in the last image was where the glacier was in 1997. The glacier receded more than two hundred yards in eight years. Holden, a village twelve miles downstream from this glacier, gets its electricity from hydroelectric power generated from watershed runoff. Their summer power largely comes from glacier runoff. When I visited Holden in 2003, they were having a science meeting about what to do when the glaciers that feed Holden all melt away in about twenty years. I was tempted to bring up free energy, but they have to do plenty of paradigm busting before they can wrap their minds around that concept.

On January 21, 1990, the *New York Times* ran the below photograph. It depicts Lebanese journalists marching in a demonstration. The sign behind them translates to "Freedom of the press. Yes to the (printed) word, no to terror." The *Times* informed its readers that the sign said "In Allah's hands we are safe." Nabeel Abraham informed the *Times* of their error. The *Times* never printed a retraction or correction.

Wide World Photos

On September 12 of the same year, as George Bush the First was whipping up a murderous anti-Arab frenzy in America, the *New York Times* ran a picture of the Bank of Kuwait's logo on page C1. The Arabic script ringing the camel translates to "National Bank of Kuwait, Kuwait, 1952." The *Times* told its readers that the script translates to "There is no deity but Allah." Abraham again informed the *Times* about their "translation," and the *Times* again never printed a correction or retraction.

HOW THE NEWS WORKS... STEP ONE:

Images that Norman Schwarzkopf never regaled the American press with

This was a child who was hiding in a Baghdad bomb shelter on the night of February 13, 1991. The child was taking shelter there with about a thousand other women and children. The United States said the bomb shelter was an Iraqi military command center, a claim that was obviously false, and used a sophisticated bomb to penetrate the bomb shelter and incinerate its interior. Several hundred women and children died in that bomb shelter that night. The next day, on America's airwaves, the pundits were spinning the event as some sort of propaganda ploy by Saddam Hussein. From the Commission of Inquiry for the International War Crimes Tribunal, led by Ramsey Clark.

This was one of at least 100,000 Iraqi soldiers, mainly conscripts, who died in 1991 at the hands of the United States. This soldier, like nearly all the other dead ones, probably never even saw a U.S. soldier in the flesh before he died. Copyright 1991, Kenneth Jarecke/Contact Press Images.

This was an Iraqi soldier who was retreating from Kuwait under the orders of Saddam Hussein. He was one of many thousands of Iraq soldiers, civilians and Kuwaiti prisoners of war who were retreating to Iraq. They were in a caravan that was seven miles long. The United States spotted the retreating caravan, dropped bombs to disable the front and rear of the caravan, and then flew numerous missions, dropping cluster bombs and other weaponry on the helpless caravan. At least 10,000 people died on that stretch of highway, subsequently dubbed the "Highway of Death." Bombing a retreating army that posed no military threat is, by the Geneva Convention's definition, a war crime. Copyright 1991, Kenneth Jarecke/Contact Press Images.

or a square chin?

Possible crop line to forge Oswald's face onto the body

Where is
his
forearm?
Elbow?

Notice the flat fingertips. Did he have an accident with the meat cleaver?

Notice the rounded, tapered fingertips on his left hand.

Note the healthy shadows below the eyebrows, nose and lower lip, the shadow lengths about equivalent to the distance the features stand out from the face.

The fingers cast *no* shadow on the newspaper. This is even more evident in higher resolution photos.

The Serial Number Discrepancy

This is from an analysis by Jerry McLeer. The rifle was photographed during the Warren Commission investigation by FBI arms expert Robert Frazier. In 1983, the National Archives allowed Michael O'Neill of *Life Magazine* to photograph the murder weapon. McLeer presented several discrepancies between the two rifles, and the serial number discrepancies are most impressive.

The right image is from the Warren Commission in 1964, the left image is from *Life Magazine*, from its photo session at the National Archives. Note how the section where the serial number is stamped slightly "balloons" going leftward, in the Warren Commission photo. Also note the irregularity in the metal surface below the serial number in the Warren Commission photo, an irregularity that is not present in the *Life Magazine* photo.

Note the distinct differences in the serial numbers, particularly in the "C" and "2." The "C" in the *Life* photo has a rounded bottom, while the Warren Commission "C" has a serif on the bottom that makes the "C" resemble a "G." Similarly, the "2" in the *Life*/National Archives rifle is less ornate than the Warren Commission rifle. "2," with the Warren Commission "2" having a "teardrop" end to it, a fatter vertical shaft, and the "tail" of the "2" nearly comes up and touches the vertical shaft. Note the difference in the gap between the tail and the shaft in both "2s." There is a very distinctly larger gap in the *Life*/National Archives "2."

These are obviously not the same serial numbers, which means they are not the same rifles. Whoever performed the forgery of creating two rifles obviously did a very sophisticated job, but there is no perfect crime, and this is some evidence of the forgery. McLeer presents far more evidence in his analysis.

Official
autopsy
photograph

The location where
nearly every
Parkland Hospital
medical witness
placed JFK's major
head wound.

Like the crop line on
Oswald's chin, is this
a crop line where the
wound was covered
up? See the radical
change in the hair
above and below the
line; above is shiny
and wet, below is dry,
and it looks like a
different color.

The Rover is superimposed over the crosshair. The debunkers say it is a case of the white of the Rover bleeding over the crosshair.

There is an abrupt transition from foreground to distance, as if the scene is shot with a backdrop. NASA says it is because of the moon's tight curvature that the marked contrast such as this exists in many lunar photos. NASA frame # AS16-107-17446

The famous "C" rock, thought to be a hoax by the debunkers, or perhaps an innocent color processing code. Steve Troy finally resolved the issue. See "C" in hyper-enlargement below. It is a hair that got on a lens when copying the image in a later generation.

The shadows cast by the rocks and Rover are not parallel. An uneven terrain can explain this phenomenon.

The Rover makes a ninety-degree turn in a few feet, while jumping over this boulder. This is a remarkable feat, in one-sixth gravity. Perhaps it was going very slowly.

Space shuttle hypergolic
rocket exhaust

From the Clavius site. It is the exact fuel used in the LM, in a vacuum environment, at the Arnold Engineering Development Center. Though the jet appears more widely dispersed than the LM blast, this is a less visible flame than others. I would not call it invisible, though. That, combined with the daylight on the moon and video cameras, may account for the lack of visible exhaust.

Apollo 16 LM liftoff sequence

2

3

Brightest the light gets

4

5

No exhaust light or stream

6

Dust kicked up

7

On its way, no visible light or exhaust.

Apollo 17
LM liftoff

Until now, this was considered to be the Greatest Athletic Feat ever Recorded on the Moon

The image on the left is taken with a still camera on Apollo 14. The image on the right is taken with a video camera on Apollo 17. Discussion of the faceplate sun reflection discrepancies is in the text.

Distance from bottom of boot to ground is the same distance as from bottom of boot to knee, which is 18 inches for a six-foot-tall man.

In one-sixth gravity, his leap should have reached more than four times the height that he could have reached on earth. Wearing a suit that weighed slightly more than he did, an eighteen-inch leap on the moon was the equivalent of a 4.5-inch earth "leap." My grandmother could have done that. Jumping up one stair in a home takes more effort.

He bent his legs and lowered and raised his arms normally for a standing jump.

A leap such as this, the equivalent of a mere 12 inch earth leap, would have been an impressive feat that displayed the one-sixth-earth gravity of the moon. It turns out, though, that somebody *did* perform a feat of that magnitude. It has not been part of the debate until now.

These frames are from the official NASA footage of the Apollo 13 mission. Although they supposedly had to conserve their electricity consumption to a minimum, they could still power their video camera to record the events on board. These frames were supposedly taken while in space well beyond earth orbit, between earth and its moon. There should be no "blue sky" out there. How can there be blue light coming through the windows? The obvious answer is that the footage was not taken on the way to the moon or on the way back, but in earth orbit. The debunker explanation has been that ice crystals on the windows caused the blue color. There were no visible ice crystals on the windows.

Here are some Apollo 11 photographs, supposedly taken beyond earth orbit, also with blue windows. perhaps there is a prosaic explanation. At this time, I am satisfied that this Apollo 11 footage was taken far beyond earth orbit.

Day 1, GET 12 hours
NASA frame AS11-36-5337
50,000 miles out.

Day 2, GET 34 hours
Sibrel footage,
130,000 miles out

Day 3, GET 59 hours
AS11-36-5374
176,000 miles out

This "snake" looks identical for these two days

Three days during May 2001. San Joaquin Valley looks like a peninsula here too. The cloud patterns have not shifted all that much. The NASA footage appears to have reasonable relative lack of shift, at least to me.

He lands on the third stair of the LM with his leap.

Neil Armstrong, about to hop onto LM ladder and leave the lunar surface.

Puts hands to ladder here.

In mid-flight here.

Notice how he bends his knees.

In comparing pre and post-leap frames, he appears to have achieved about chest height with his leap, or four feet high. Here is the evidence I sought for so long.

Snake Goddess, c. 1600 B.C.
Palace of Knossos, Crete.
Archeological Museum, Iráklion, Greece

Temptation in the Garden of Eden.
Michelangelo, Sistine Chapel ceiling.

The caduceus, the symbol of medicine today.
The staff of Asclepius, the Greek god of
healing, had one serpent entwine his staff.
His daughters included Hygeia, the goddess
of health, and Panacea, the goddess of healing.

This series of photographs is of Chicago policeman Thomas Mannix. His cancerous shoulder had already been treated with surgery and radiation, and he was given a few weeks to live by orthodox medicine. Harry Hoxsey had recently opened his first cancer treatment clinic in early 1924, and impressed doctors arranged to have Hoxsey treat this terminal policeman, only to see if the treatment was toxic. They expected no improvement in the policeman's condition, and Hoxsey treated the man, with the results seen above. When the policeman miraculously recovered, Morris Fishbein became involved and Hoxsey was offered a contract to sign over the rights to Fishbein and friends. When Hoxsey refused to sign the contract, because Fishbein and friends would not treat patients if they could not pay, Fishbein led a crusade against Hoxsey that ultimately ruined Fishbein's career, as well as driving Hoxsey's cure from the United States.

Royal Rife's Universal Microscope, built in 1933.

The somatidian cycle as discovered by Gaston Naessens

A typical stained blood specimen, seen with a light field microscope.

Living blood as seen with the Somatoscope. The inter-cellular "debris" are somatids and other organisms.

Some of the Unsung Heroes of Microbiology and Medicine

Antoine Béchamp (1816-1908), the father of pleomorphic microbiology, whose work Louis Pasteur apparently plagiarized, but corrupted due to his lack of understanding.

Royal Rife (1888-1971), inventor of the world's most powerful microscope in the 1930s, which had more than ten times the resolution of standard light microscopes. Rife confirmed Béchamp's pleomorphic theories and created an effective disease treatment based upon his discoveries. It cured cancer and other diseases.

Gaston Naessens (b. 1924), inventor of the Somatoscope, which gained optical resolutions similar to Rife's. Naessens also invented an effective disease treatment based on his discoveries. It cures cancer and other diseases.

THIS MODERN WORLD

by Tom Tomorrow

IT'S TIME FOR YET ANOTHER LOOK AT HOW THE NEWS WORKS...**STEP ONE:** A CORPORATION WHICH HAS BEEN CAUGHT ENGAGING IN SOME ILLEGAL OR UNETHICAL ACT HIRES A **PUBLIC RELATIONS FIRM...**

PEOPLE ARE **UPSET** BECAUSE WE'VE BEEN DUMPING **TOXIC SLUDGE** INTO THE WATER SUPPLY!

WELL--BY THE TIME **WE'RE** THROUGH, THEY'LL **THANK YOU** FOR IT!

STEP TWO: THE P.R. FIRM PROCEEDS TO MANIPULATE PUBLIC OPINION IN A VARIETY OF DEVIOUS, UNDERHANDED WAYS-- SUCH AS ANONYMOUSLY PLANTING OP-ED PIECES IN THE NATION'S **NEWSPAPERS...**

SEPTEMBER 27, 1992

What's So Bad About Toxic Sludge?

by Joe Pundit

When asked what their goal was with this column, the author stated that it was to provide a "balanced" view of the issue. The author stated that they were not taking sides, but were simply providing a "balanced" view of the issue. The author stated that they were not taking sides, but were simply providing a "balanced" view of the issue. The author stated that they were not taking sides, but were simply providing a "balanced" view of the issue.

...AS WELL AS SENDING OUT SLICKLY-PRODUCED "VIDEO NEWS RELEASES" WHICH MANY CASH-STRAPPED LOCAL NEWS DEPARTMENTS AIR VIRTUALLY **UNEDITED...** GIVING CORPORATE PROPAGANDA THE APPEARANCE OF OBJECTIVE **REPORTING...**

...AND SO YOU SEE, TOXIC SLUDGE IS ACTUALLY QUITE **GOOD** FOR YOU!

STEP THREE: PUBLIC OPINION IS **SWAYED** BY THIS ONSLAUGHT OF MEDIA MANIPULATION MASQUERADING AS **NEWS...** SINCE, AS P.R. FIRMS WELL UNDERSTAND, ANY LIE REPEATED **OF-TEN** ENOUGH BECOMES **TRUE...**

I CAN'T IMAGINE WHY WE EVER WORRIED ABOUT **TOXIC SLUDGE!**

YES--HOW **SILLY** WE WERE!

This is a diagram of a standard air-to-air heat pump for a typical American home. The evaporator looks like an automobile radiator, and provides a few square feet, at best, of evaporator contact with the environment. The fan increases the environmental heat exchange.

These are the evaporator arrays of some LamCo-style heat pumps in the field.

November 2, 1979

Bill:

Thank you for allowing us to instrument your one-third horsepower solar assisted LamCo system. The results were better than anticipated and I attribute this to the wind we experienced on that day. Even though the sky was partly cloudy and temperatures around 50 degrees farenheit, the empirical data showed a COP of seven.

Raw Data

1. Flow rate (heat exchanger) = 2 gal/min
2. Delta T = 6 degrees farenheit
3. Input power = 248.67 watts

Calculations

Input power to BTU's/hr =
 $248.67 \times 3.41 = 847.95 \text{ BTU's/hr}$

Output BTU's/hr =
 $8.32 \text{ lb/gal} \times 2 \text{ gal} = 16.64 \text{ lb/min}$
 $16.64 \text{ lb/min} \times 6 \text{ degrees} = 99.84 \text{ BTU's/min}$
 $99.84 \text{ BTU's/min} \times 60 = 5990.4 \text{ BTU's/hr}$

$$\text{COP} = \frac{5990.4 \text{ BTU out}}{847.95 \text{ BTU in}} = 7.06$$

Thanks again Bill,

W Senior Engineer

c/o Solar Heating System
JKD/ns

Bill: LamCo specifications for L-033 unit at 50° show a C.O.P. of 3.37. The letter shows that it more than doubled with partly cloudy and wind.

An Image From a Fun Day

This is Dennis, in his white tuxedo, speaking to a "crowd" of about 35 people, in the Old South Meeting Hall in Boston, where some of America's Founding Fathers met before they had the Boston Tea Party. This was Dennis' first Greatest Energy Show on Earth, which shows both his P.T. Barnum nature and his indefatigable patriotism. Those were happy and innocent days for me.

Some Images from a Not-So-Fun Day

These are pictures of Mr. Deputy and friends hauling off our demonstration units during the raid, with me supervising. Notice Mr. Deputy's gun. I am standing against the wall. Behind that wall was Mr. Researcher's office. Unbeknownst to me at that time, the sheriff's deputies had ransacked Mr. Researcher's office hours earlier, before their official search began, and took a few boxes of technical documents out of the building, which we never saw again, nor did they ever admit to taking them. Mr. Researcher and our machinist were able to see through the machine shop's windows, and they saw them (that deputy in the tie) photographing our prototype blueprints, while rolling them out on Mr. Researcher's desk. They repeatedly denied doing it, even though we saw them in the act. Mr. Deputy even told Mr. Researcher that Dennis stole his own documents the night after the raid, to fabricate an appearance of the sheriff's crime. Nobody believed that lie, but because Mr. Deputy had the gun, badge, jail and Kangaroo Court on his side, Mr. Researcher did not challenge his lie at the time. He testified in court to it years later, though.

This is an image of the deputies occupying the front lobby of our building, with Dennis' wife (out of view to the left of the doorway, outside of it) trying to challenge the legality of their occupation. We were on the outside looking in. Unknown to me, the man in the tie, barely visible in the background, had already photographed our prototype blueprints. The full extent of their crime was not evident until the next morning, when we were finally allowed back into our premises.

REGISTRATION CARD 27/27

1 Name Paul C. Bragg (Last name) (First name) 22

2 Address 2435 N. New Jersey Ind. 100

3 Date of birth Feb 6th 1895

4 How you (1) a natural born citizen, (2) a naturalized citizen, (3) an alien, (4) or have you declared your intention to become a citizen? natural born

5 Where born Batesville Ind. U.S.A. (Town) (State) (Country)

6 If not a citizen, of what country are you a citizen or subject?

7 What is your present occupation, profession, or office? Insurance agent

8 By whom employed? Metropolitan Life Ins. Co.

9 Where employed? 1411 Merchants Bank Bldg.

10 How long a father, mother, or a child under 12, or a minor or brother under 12, solely dependent on you? wife

11 Married or single? Married Race Caucasian

12 What military service have you had? Rank private Natl. Guard

13 3 yrs Washington D. C.

14 Do you have other persons living with you? dependent wife

I affirm that I have written above answers and that they are true.

Paul C. Bragg

16-4539-4

A black and white photograph of a handwritten signature, "Paul C. Bragg", in cursive. The signature is written on a document that appears to be a draft card, with some printed text visible above and below the signature.

Above is Paul C. Bragg's signature from his 1917 draft card, which noted his birthday as February 6, 1895, in Indiana, and his profession as an insurance agent.

A black and white photograph of a handwritten signature, "Paul C. Bragg", in cursive. The signature is written on a document that appears to be a Social Security application, with printed text visible above and below the signature.

Above is Paul C. Bragg's signature from his 1949 Social Security Account Number application, which also noted his February 6, 1895 birthday.

A black and white photograph of a handwritten signature, "Paul C. Bragg", in cursive. The signature is written on a document that appears to be a book cover or endpaper, with printed text visible below the signature.

Above is Paul C. Bragg's signature in the 1976 edition of his *The Miracle of Fasting*. All three signatures are virtually identical, with the forward slant of the "P" and "B" in the 1976 signature evident in the 1949 signature. The same Paul C. Bragg made all three signatures.

C. Bragg made all three signatures.
